

SB 44/2015

30 July 2015

Fire statistics Wales, 2014-15

This bulletin presents fire incident statistics for Wales. The Welsh Government compiles these annual statistics from reports on all fires attended submitted by all Fire and Rescue Services (FRSs) in Wales to the Department for Communities and Local Government (CLG).

The bulletin provides in-depth analysis of fire incidents attended by Welsh Fire and Rescue Services (FRSs). Analysis includes details on location, cause, motive, casualties and false alarms attended. The data contained in this bulletin is used to inform policy decisions and to provide contextual information. The data is used by the Welsh Government to help monitor trends in incidents attended by FRSs over time and provides information on FRSs' performance and activities to citizens and communities in Wales.

The bulletin presents the most recent data (2014-15) and shows time series from 2001-02 where possible. The 2014-15 data are currently provisional, extracted from the Incident Recording System (IRS) in June 2015 and may be revised in subsequent publications. A table comparing the provisional 2013-14 data (from last year's bulletin) and the updated figures in this bulletin is shown in Section 11 – Quality Information. All fire data from 2009-10 onwards are taken from IRS, earlier fire data are based on a sampled dataset, taken from the Fire Data Reports (FDR1 and FDR3). More information on the sources of data are contained in Section 11 – Quality Information.

In 2014-15 fire-fighters in Wales took part in several periods of strike action. Further information regarding this issue can be found in Section 11 – Quality Information.

Definitions of all terms used can be found in the glossary at the end of this bulletin.

Excel versions of the tables contained in this bulletin are also published:

Summary

Fires:

- In 2014-15 the number of attendances at fire and false alarm incidents by Welsh Fire and Rescue Services decreased by 5 per cent compared with the previous year. Since 2001-02 there has been a downward trend in the number of incidents attended; the 2014-15 figure is 50 per cent lower than in 2001-02. (*Section 1, table 1*)
- The number of primary fires in Wales decreased by 5 per cent over the year from 4,790 in 2013-14 to 4,560 in 2014-15. Primary fires include all fires in non-derelect buildings and vehicles or in outdoor structures, or any fire involving casualties or rescues, or fires attended by five or more appliances. (*Section 1, table 1*)

Casualties:

- There were 21 fatal casualties from fires in Wales in 2014-15. (*Section 4, table 8*)
- The number of non-fatal casualties was 543 in 2014-15, a decrease of 13 per cent compared with 2013-14. (*Section 4, table 9*)

False alarms:

- In 2014-15 there were 15,482 false fire alarms in Wales, up from 15,312 in 2013-14, an increase of 1 per cent. (*Section 5, chart 16*)
- The number of malicious false fire alarms decreased from 646 in 2013-14 to 605 in 2014-15. (*Section 5, table 12*)

Smoke alarms:

- In around 3 in 10 dwelling fires in Wales in 2014-15, no smoke alarm was installed. (*Section 6, chart 17*)

Cause of Fires:

- In 2014-15 the largest single cause of accidental dwelling fires was misuse of equipment or appliances, equating to 36 per cent. This has consistently been the main cause of accidental dwelling fires since 2001-02. (*Section 7, table 19*)

Response Times:

- In 2014-15, 71 per cent of primary fires and 76 per cent of dwelling fires in Wales were attended within 10 minutes. (*Section 8, tables 24 and 25*).

Section 1: Fires

Fires are classed as primary, secondary or chimney fires.

Primary fires include all fires in non-derelict buildings and vehicles or in outdoor structures, or any fire involving casualties or rescues, or fires attended by five or more appliances.

Secondary fires are mainly outdoor fires including grassland and refuse fires unless they involve casualties or rescues, or are attended by five or more appliances. They include fires in single derelict buildings, derelict road vehicles and derelict outdoor structures.

Chimney fires are reportable fires in occupied buildings where the fire was confined within the chimney structure and did not involve casualties or rescues or are attended by 5 or more appliances.

This section looks at the total number of fires that occurred as well as the total number of fires attended, which includes false alarms.

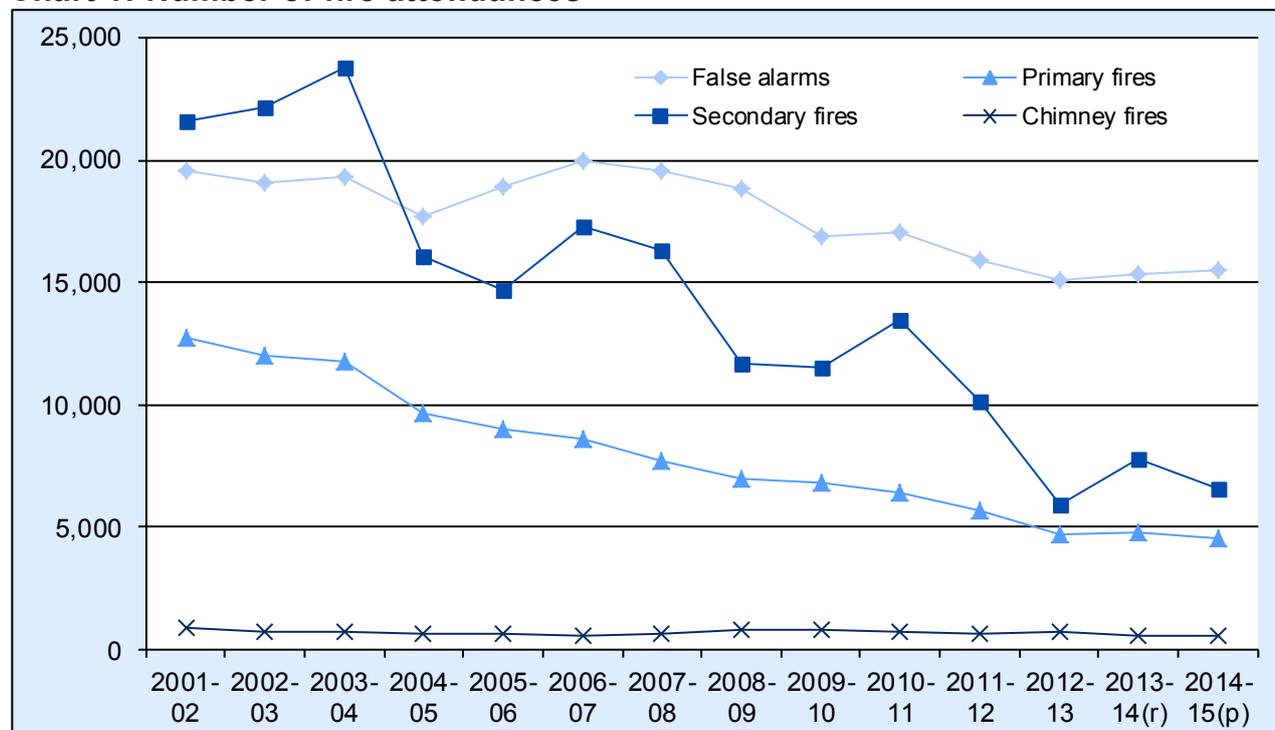

1.1 Fires attended

The Welsh Fire and Rescue Services attended 27,132 fires and false alarms in 2014-15, a decrease of 5 per cent compared with 2013-14. Fire attendances consist of attendances at primary fires, secondary fires, chimney fires and false alarms. In 2014-15, of all attendances, 4,560 were primary fires (17 per cent), 6,541 secondary fires (24 per cent) and 549 chimney fires (2 per cent). A further 15,482 incidents attended were false alarms, equating to more than half of all fire attendances.

Since 2001-02 all types of attendances have fallen, numbers of primary fires falling by 64 per cent, secondary fires by 70 per cent, chimney fires by 39 per cent and false alarms by 21 per cent.

Whilst there is an overall downward trend in the numbers of false alarms and secondary fires, they have been erratic and prone to fluctuation. Section 3 focuses on whether the fire was accidental or deliberate and highlights that the fluctuation in the number of secondary fires is due to those started deliberately.

Percentage change 2013-14 to 2014-15	+1	-5	-16	-5	-5

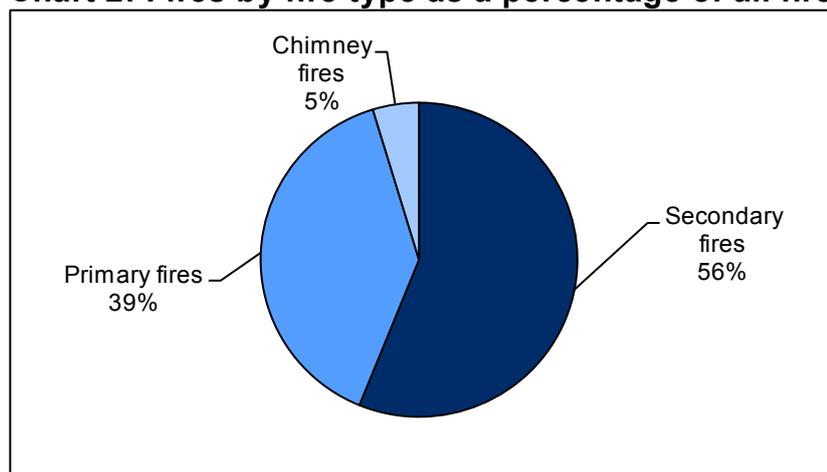

(r) Revised data.

(p) Provisional data.

1.2 All fires

In 2014-15 there were 11,650 fires attended in Wales, a decrease of 12 per cent compared with 2013-14. Since 2001-02 the number of fires has fallen by 67 per cent.

In 2014-15 secondary fires accounted for 56 per cent of all fires, primary fires accounted for 39 per cent and chimney fires 5 per cent. Prior to 2011-12 secondary fires had accounted for at least 6 in 10 fires each year, but this proportion has fallen in recent years, driven by the greater reduction in secondary fires compared with primary fires.

Chart 2: Fires by fire type as a percentage of all fires, 2014-15(p)

(p) Provisional data.

Further data on this topic is available on StatsWales:

<https://statswales.wales.gov.uk/Catalogue/Community-Safety-and-Social-Inclusion/Community-Safety/Fire-Incidents/Fires-and-False-Alarms>

Section 2: Fires by type

2.1 Primary fires

Primary fires include all fires in non-derelict buildings and vehicles or in outdoor structures, or any fire involving casualties, rescues, or fires attended by five or more appliances.

In 2014-15 provisional figures show the number of primary fires decreased by 5 per cent compared with the previous year, to 4,560. All FRSs saw decreases in the number of primary fires.

Table 2: Number of primary fires by Fire and Rescue Service

	North Wales	Mid and West Wales	South Wales	Wales
2001-02	2,382	3,959	6,380	12,722
2002-03	2,160	3,636	6,234	12,030
2003-04	2,181	3,460	6,160	11,802
2004-05	1,822	2,797	5,015	9,633
2005-06	1,738	2,676	4,603	9,017

Percentage change				
2013-14 to 2014-15	-5	-4	-6	-5

(r) Revised data.

(p) Provisional data.

Since 2001-02 both Mid and West Wales and South Wales have seen falls of over two-thirds in the number of primary fires. In North Wales the number has fallen by 55 per cent. The FRSs in Wales have a number of ongoing fire safety campaigns¹ and community fire safety work (such as home safety checks and school visits²) and these may be a contributory factor in the falling numbers of fires although no evidence is currently available.

(a) Includes caravans, houseboats and other non-building structures used solely as a permanent dwelling.

(r) Revised data.

(p) Provisional data.

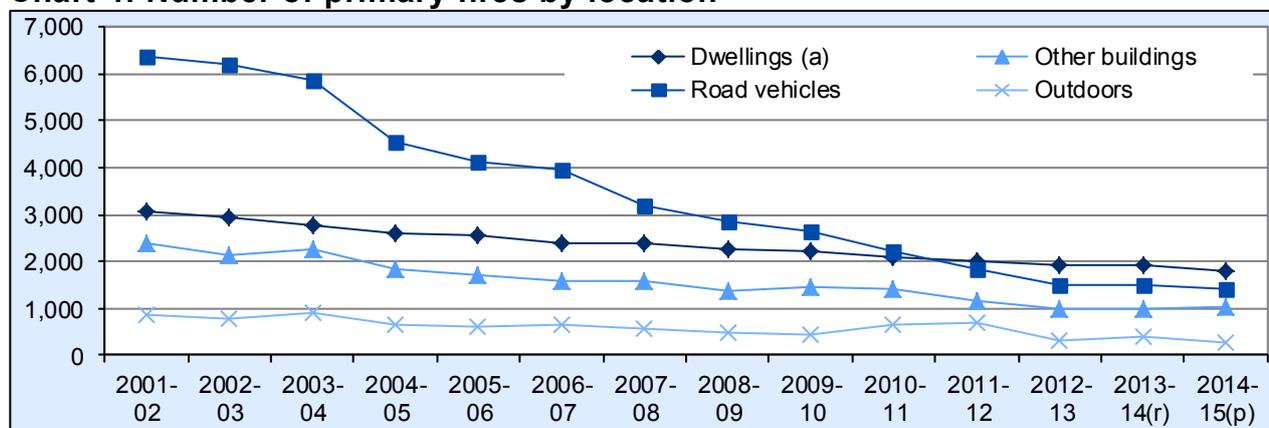

. not applicable

In Wales in 2014-15, 40 per cent of all primary fires were in dwellings, 31 per cent in road vehicles, 23 per cent in other buildings and 6 per cent were outdoor fires. Only fires in ‘other buildings’ saw an increase in 2014-15 (of 4 per cent) which was driven by an increase in the number of accidental non-residential building fires. The number of primary outdoor fires fell by 29 per cent in 2014-15 to the lowest figure in the time series.

Since 2001-02 dwelling fires have fallen by 41 per cent. FRSs report they have conducted almost 450,000 home fire safety assessments/visits in the years 2008-09 to 2013-14³ (not National Statistics).

2011-12 was the first year in the time series in which numbers of primary dwelling fires outnumbered numbers of primary fires in road vehicles in Wales and this has continued to be the case in the following years. Primary fires in road vehicles in Wales have fallen by 78 per cent since 2001-02. More analysis of fires in road vehicles can be found in section 3.

Chart 4: Number of primary fires by location

(a) Includes caravans, houseboats and other non-building structures used solely as a permanent dwelling.

2.2 Secondary fires

Secondary fires are the majority of outdoor fires including grassland and refuse fires unless they involve casualties or rescues, property loss or are attended by five or more appliances. They include fires in single derelict buildings, derelict road vehicles and derelict outdoor structures.

Since 2001-02 secondary fires have typically accounted for between 59 and 66 per cent of all fires attended by Welsh Fire and Rescue Services. The exceptions are 2012-13, when secondary fires accounted for 52 per cent of all fires and 2014-15 (56 per cent). In both cases this drop in the proportion was largely due to a fall in the number of deliberate outdoor fires. Numbers of deliberate fires are explored in more detail in Section 3.

Provisional figures show the Welsh Fire and Rescue Services attended 6,541 secondary fires in 2014-15, a decrease of 16 per cent on 2013-14. This is the second lowest figure in the available time series (beginning in 1995-96). Compared with the previous year, all three Welsh FRSs saw decreases of between 11 and 18 per cent in the numbers of secondary fires in 2014-15. In South Wales secondary fires accounted for 63 per cent of fires in the area in 2014-15. In North Wales and Mid and West Wales the proportions were 43 per cent and 52 per cent respectively.

Table 4: Number of secondary fires by Fire and Rescue Service

	North Wales	Mid and West Wales	South Wales	Wales
2001-02	3,071	4,809	13,705	21,585
2002-03	3,023	5,254	13,914	22,191
2003-04	3,600	5,461	14,681	23,742
2004-05	2,301	4,130	9,617	16,048

2013-14 (r)	1,087	2,151	4,563	7,801
2014-15 (p)	964	1,826	3,751	6,541
Percentage change				
2014-15 to 2013-14	-11	-15	-18	-16

(r) Revised data.

(p) Provisional data.

In 2014-15, 5,428 (83 per cent of) secondary fires occurred on grassland, woodland, crops and other land. This is a fall of 17 per cent since the previous year and is the second lowest figure in the time series. The number of these fires is likely to have been influenced by weather conditions; for example, 2012-13 saw 48 per cent more rainfall than the previous year and was the second wettest financial year since 1910-11 (this increase in rainfall in 2012-13 coincided with the 46 per cent drop in grassland, woodland and crop fires and other outdoor fires occurring on land). Further analysis using weather data is shown in Section 3.

Aside from those occurring on grassland, woodland, crops and other land, a further 15 per cent of secondary fires took place in outdoor structures, whilst those in derelict buildings, outdoor machinery and equipment and derelict road vehicles each made up 1 per cent.

In 2014-15, 52 per cent of secondary fires were classed as refuse fires⁴. The number of these fires has risen by 4 per cent from 3,279 in 2013-14 to 3,400 in 2014-15 and can be attributed to a rise in

⁴ Data on refuse fires can be found in StatsWales table 'Fires by detailed location and motive' <https://statswales.wales.gov.uk/v/u3j>

the number of fires occurring on loose refuse. This is the second year in a row to see a rise in the number of refuse fires, prior to this the number of these fires had been falling despite the rise in 2014-15 there has been a 34 per cent reduction since 2009-10. Over three-quarters of refuse fires in 2014-15 occurred on loose refuse. A number of projects including 'Tidy Towns⁵' and 'Fly Tipping Action Wales⁶' are attempting to address the issues of litter and fly-tipping. In 2013-14, the number of fly-tipping incidents (recorded by local authorities) in Wales fell by 6 per cent compared with the previous year, and has fallen by 40 per cent since 2006-07. Keep Wales Tidy is also aiming to prevent litter from occurring through education and awareness raising via the Eco-schools programme⁷. This is an international initiative which encourages pupils to engage with environmental and also sustainable development issues.

More Data on fly-tipping in Wales can be found here:

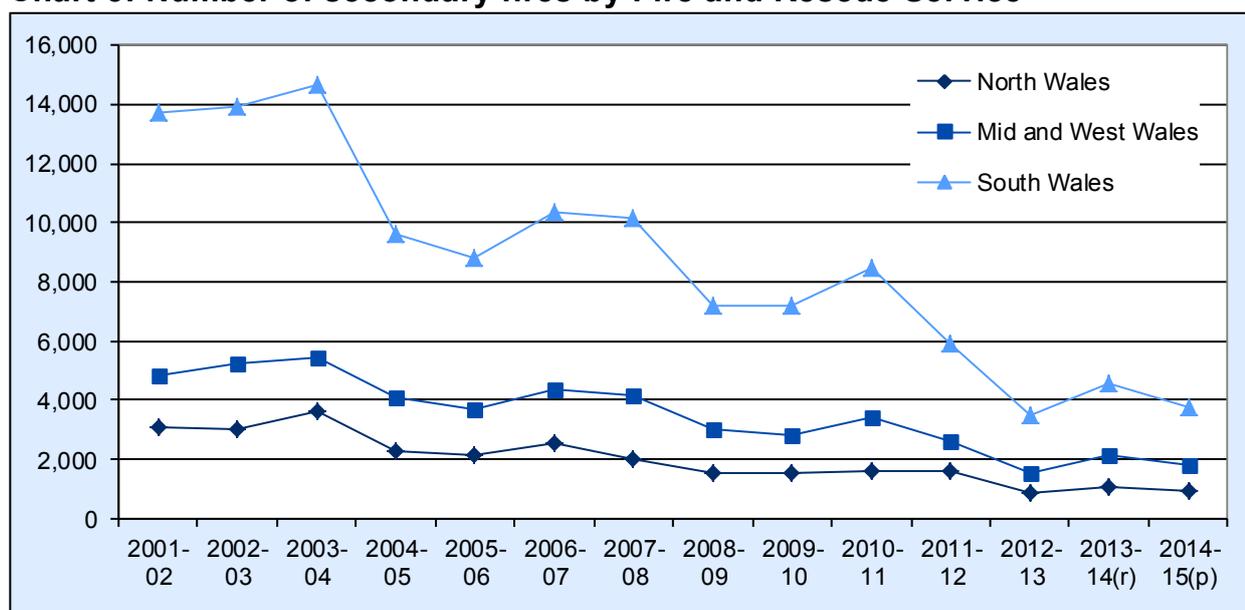

<http://wales.gov.uk/topics/statistics/headlines/environment2012/120816/?lang=en>

and StatsWales tables:

<https://statswales.wales.gov.uk/Catalogue/Environment-and-Countryside/Fly-tipping>

In 2014-15, the majority of secondary fires, 57 per cent, occurred in South Wales. Mid and West Wales accounted for 28 per cent of all secondary fires and 15 per cent were in North Wales. However the number of secondary fires in all 3 Welsh Fire and Rescue Service areas have seen substantial falls since 2001-02; in South Wales by 73 per cent, North Wales 69 per cent and in Mid and West Wales 62 per cent.

Chart 5: Number of secondary fires by Fire and Rescue Service

(r) Revised data.

(p) Provisional data

2.3 Chimney Fires

Chimney fires are any fire in an occupied building where the fire was confined within the chimney structure (and did not involve casualties or rescues or attendance by five or more appliances).

During 2014-15, there were 549 chimney fires in Wales, a decrease of 5 per cent compared with 2013-14. The majority of these fires occurred in dwellings (96 per cent).

⁷ <http://www.keepwalestidy.org.uk/eco-schools>

Mid and West Wales saw a reduction of 17 per cent whilst both North Wales and South Wales saw increases, of 2 per cent and 11 per cent respectively (as shown in Table 5).

Table 5: Number of chimney fires by Fire and Rescue Service

Statistical analysis of chimney fire and temperature data

Since there appears to be a link between the mean temperature and the number of chimney fires, it is worth investigating this relationship further by looking at the statistical correlation between the two datasets.

The correlation coefficient, denoted by 'R²', tells us how closely data in a scatterplot fall along a straight line. The R² value ranges from 0 to 1, the closer the value is to 1 the stronger the relationship. A value close to 0 implies no relationship.

The scatter plot below shows how closely the relationship between the temperature data and chimney fire numbers are correlated. The data in chart shows the monthly mean temperature plotted against the number of chimney fires seen in that month for the years 2009-10 to 2014-15. The R² value of 0.92 indicates a strong correlation in the data which is also intuitive, that in colder months the FRSs are required to attend more chimney fires.

Chart 6a Scatter plot showing statistical correlation between numbers of chimney fires and mean temperature

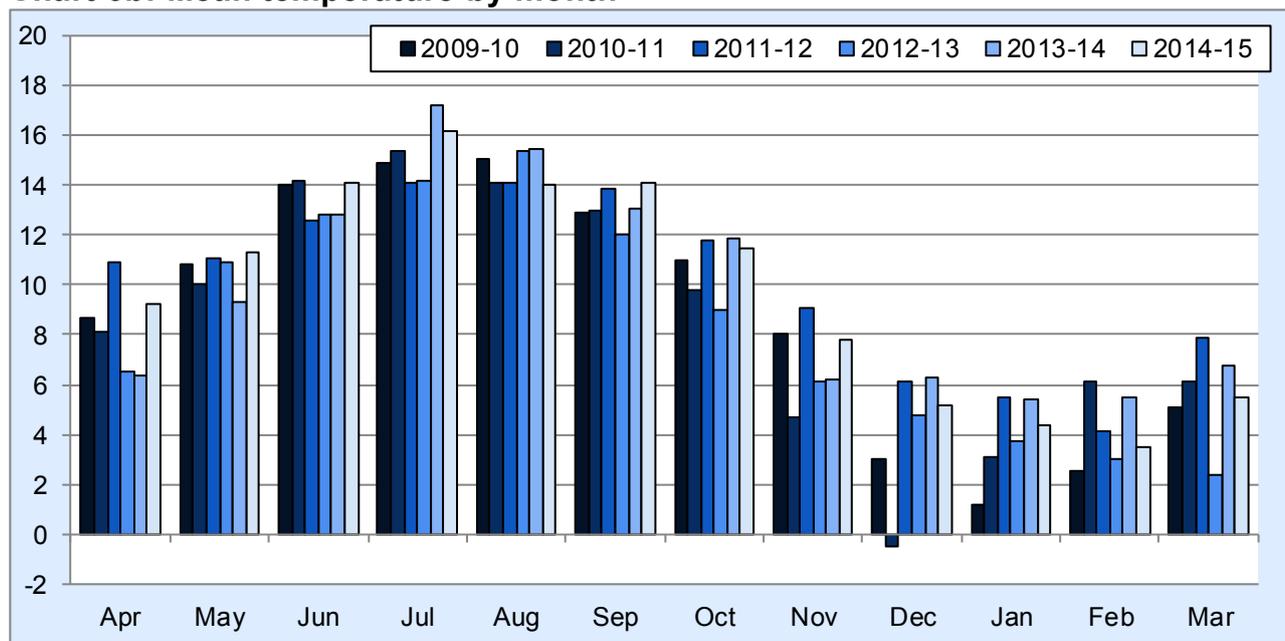

Source: Mean temperature data from the Met Office

This relationship can also be seen by comparing monthly data for chimney fires and mean temperatures.

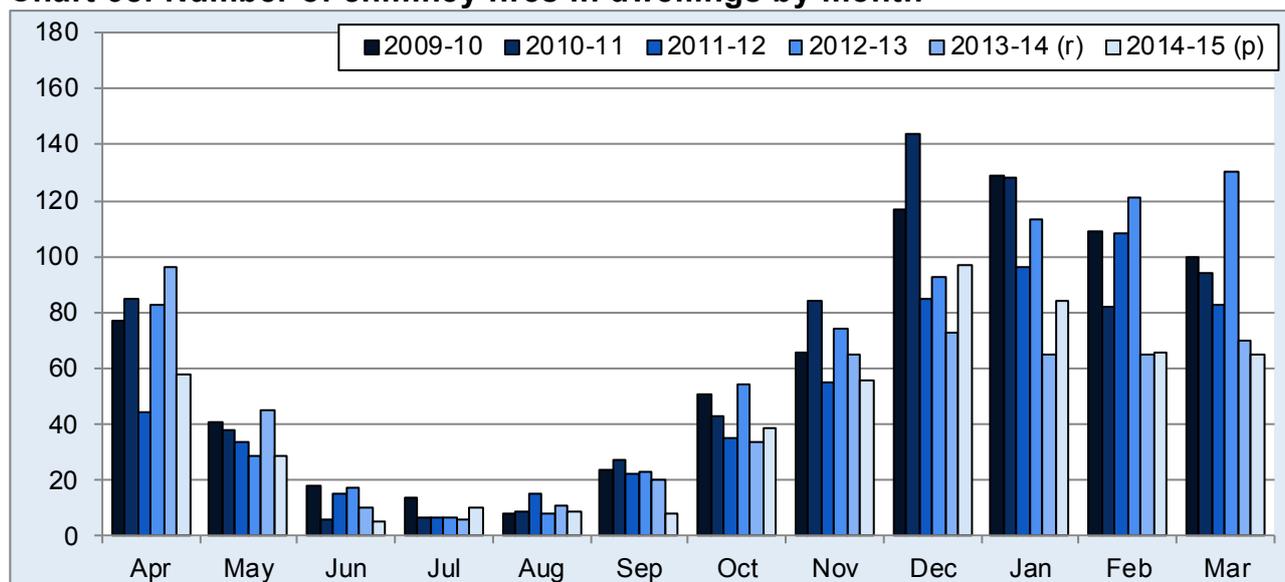

As might be expected, the number of chimney fires in dwellings is higher in the winter and colder months, for example in the charts below we see that the coldest month (December 2010) corresponds to the month with the highest instance of chimney fires. More recently, in April 2014 there were 40 per cent fewer chimney fires than in April 2013, whilst the average temperature was almost 3 degrees (44 per cent) higher. The months January to March 2015 saw an increase of 8 per cent in chimney fires compared with the same period in 2014, whilst the temperature was, on average 1.5 degrees lower.

Section 3: Fires by motive

This section looks at motive, in particular whether fires were caused accidentally or deliberately. Accidental fires are defined as fires where the fire was ignited by accident or the cause of the fire is not known or unspecified. Deliberate fires are defined as fires where the fire was ignited deliberately or if it is suspected or recorded as 'doubtful' by the Fire and Rescue Service. The chart below shows that numbers of deliberate secondary fires have been prone to fluctuation, whilst the other categories shown are less volatile.

Chart 7: Number of fires by type and motive

(r) Revised data.

(p) Provisional data.

3.1 Accidental fires

In 2014-15, 45 per cent of all fires were accidental, a similar proportion to the previous year. 73 per cent of all primary fires and 20 per cent of secondary fires were accidental. All chimney fires in 2014-15 were accidental.

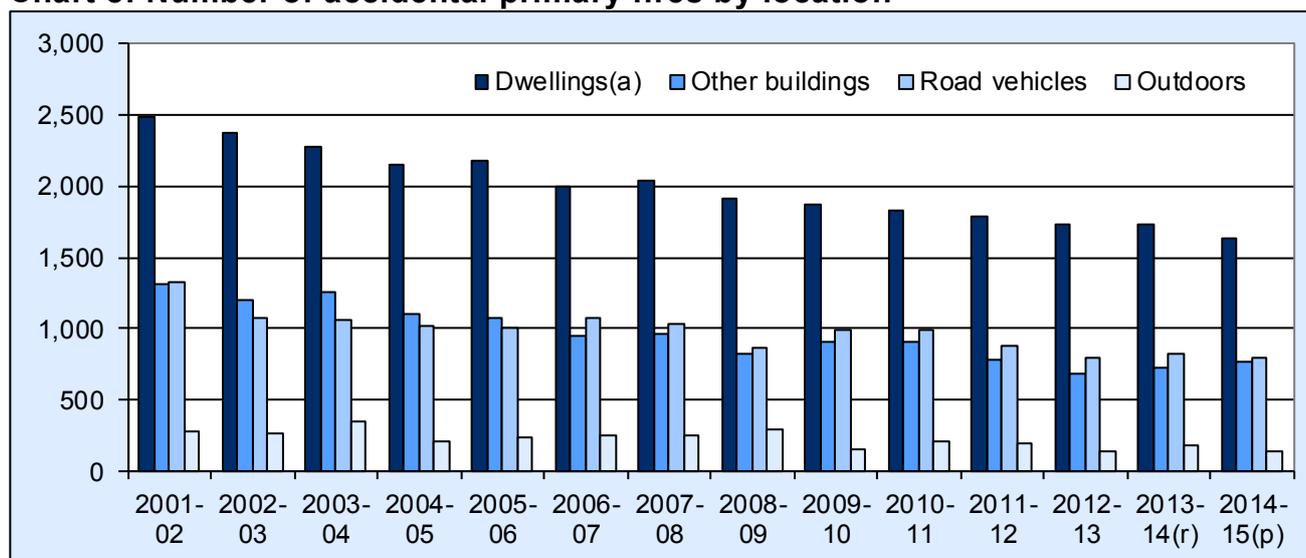

In 2014-15 the number of accidental primary fires decreased by 3 per cent whilst the number of accidental secondary fires fell by 16 per cent (compared with 2013-14) equating to 255 fewer fires. Since 2001-02 accidental fires have fallen by 43 per cent.

A large proportion of accidental primary fires occur in dwellings, equating to between 46 per cent and 52 per cent for each year since 2001-02. The number of accidental dwelling fires fell by 6 per cent in 2014-15 and in general there has been a downward trend in these fires since 2001-02 (as can be seen in chart 8), dropping by 34 per cent.

In 2014-15, 90 per cent of fires that occurred in dwellings were started accidentally, similar to the proportion seen last year but 9 percentage points higher than in 2001-02.

In recent years the proportion of primary fires in road vehicles which were started accidentally has increased from 21 per cent in 2001-02 to 56 per cent in 2014-15. In this time the number of accidental fires in road vehicles has fallen by 40 per cent.

Chart 8: Number of accidental primary fires by location

(a) Includes caravans, houseboats and other non-building structures used solely as a permanent dwelling.

(r) Revised data.

(p) Provisional data.

In 2014-15 both North Wales and South Wales saw decreases in the number of accidental primary fires in dwellings compared with the previous year, whilst Mid and West Wales saw a slight increase, as shown in Table 6.

Table 6: Number of accidental primary fires in dwellings by Fire and Rescue Service (a)

	North Wales	Mid and West Wales	South Wales	Wales
2001-02	614	821	1,055	2,490
2002-03	554	745	1,077	2,377
2003-04	501	838	940	2,279
2004-05	531	727	891	2,150
2005-06	502	749	921	2,172
2006-07	459	663	867	1,990
2007-08	526	642	867	2,035
2008-09	482	638	799	1,919
2009-10	478	584	802	1,864
2010-11	469	605	752	1,826
2011-12	476	555	758	1,789
2012-13	455	525	745	1,725
2013-14 (r)	479	572	681	1,732
2014-15 (p)	401	579	655	1,635
Percentage change				
2013-14 to 2014-15	-16	+1	-4	-6

(a) Dwellings include caravans, houseboats and other non-building structures used solely as a permanent dwelling.

(r) Revised data.

(p) Provisional data.

Over 40 per cent of accidental dwelling fires occurred between the hours of 4pm and 9pm⁹. Section 7 relates to cause and source of ignition and shows that, cooking appliances were the main source of ignition, being responsible for more than half of the accidental dwelling fires in 2014-15.

⁹ Data on time of accidental dwelling fires can be found in the StatsWales table 'Fires and casualties by time' <https://statswales.wales.gov.uk/v/u3s>

3.2 Deliberate fires

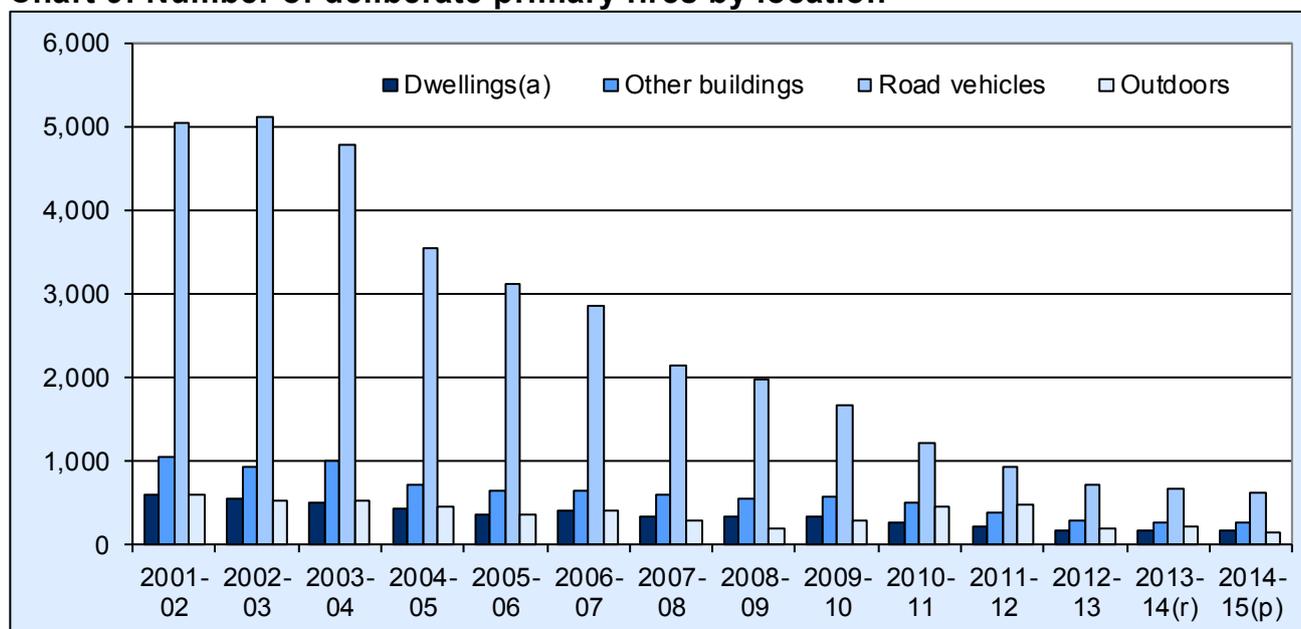

The Joint Arson Group produced the Wales Arson Reduction Strategy¹⁰ in 2007 (it was reviewed in 2009 with an updated strategy for 2012-15 published in November 2012¹¹). The strategy states the priorities of Welsh Arson Reduction Teams (ARTs) are to reduce the numbers of wildfire incidents, deliberate fires in schools, car arson, deliberate fires associated with anti-social behaviour and the number of void and derelict buildings subject to arson.

The original report noted that vehicle crime has continued to fall, and reflected that vehicles are designed and built more securely. According to police recorded crime data (not currently National Statistics) published by the Office for National Statistics¹², offences against vehicles in Wales have fallen by 72 per cent and thefts or unauthorised taking of vehicles have fallen by 83 per cent between 2002-03 and 2014-15.

There were 1,214 deliberate primary fires in 2014-15, 10 per cent fewer than in 2013-14 and 83 per cent fewer than in 2001-02. Deliberate primary fires accounted for 27 per cent of all primary fires in 2014-15.

More than half of all deliberate primary fires were in road vehicles; however the number of attendances is around an eighth of the number occurring in 2001-02.

Chart 9: Number of deliberate primary fires by location

(a) Includes caravans, houseboats and other non-building structures used solely as a permanent dwelling.

(r) Revised data.

(p) Provisional data.

¹⁰ [Wales Arson Reduction Strategy - Report of the Joint Arson Group August 2007](#)

¹¹ <http://www.southwales-fire.gov.uk/English/yoursafety/arson/Documents/Wales%20Arson%20Reduction%20Strategy%202012-2015.pdf>

¹² <http://www.ons.gov.uk/ons/publications/re-reference-tables.html?edition=tcn%3A77-373428>

In 2014-15, 4 in 5 secondary fires were deliberate, the same proportion as in the previous year. The number of these fires fell by 16 per cent compared with the previous year.

Almost half of deliberate secondary fires were classed as 'Other outdoors (including land)' in 2014-15 and the year saw a 5 per cent increase compared with the previous year. The majority of these fires (91 per cent) occurred on loose refuse.

Table 7: Number of deliberate secondary fires by location (a)

	2009-10	2010-11	2011-12	2012-13	2013-14(r)	2014-15(p)
Derelict building	163	150	137	131	91	60
Derelict road vehicle	59	39	51	26	24	28
Outdoor (b)	9,800	11,623	8,408	4,836	6,109	5,131
Grassland, woodland and crops	4,585	5,852	3,814	1,731	2,912	1,910
Outdoor structures	1,692	1,773	998	786	760	681
Outdoor equipment and machinery	21	14	22	15	15	6
Other outdoors (including land) (c)	3,502	3,981	3,573	2,303	2,419	2,534
All deliberate secondary fires	10,022	11,812	8,596	4,993	6,224	5,219

(a) Fires in non-derelict buildings, non-derelict road vehicles and non-derelict transport vehicles are primary fires.

(b) Outdoor fires include 3 secondary fires in 2010-11, 1 secondary fire in 2011-12, 1 secondary fire in 2012-13 and 3 in 2013-14, in derelict 'other transport vehicles'.

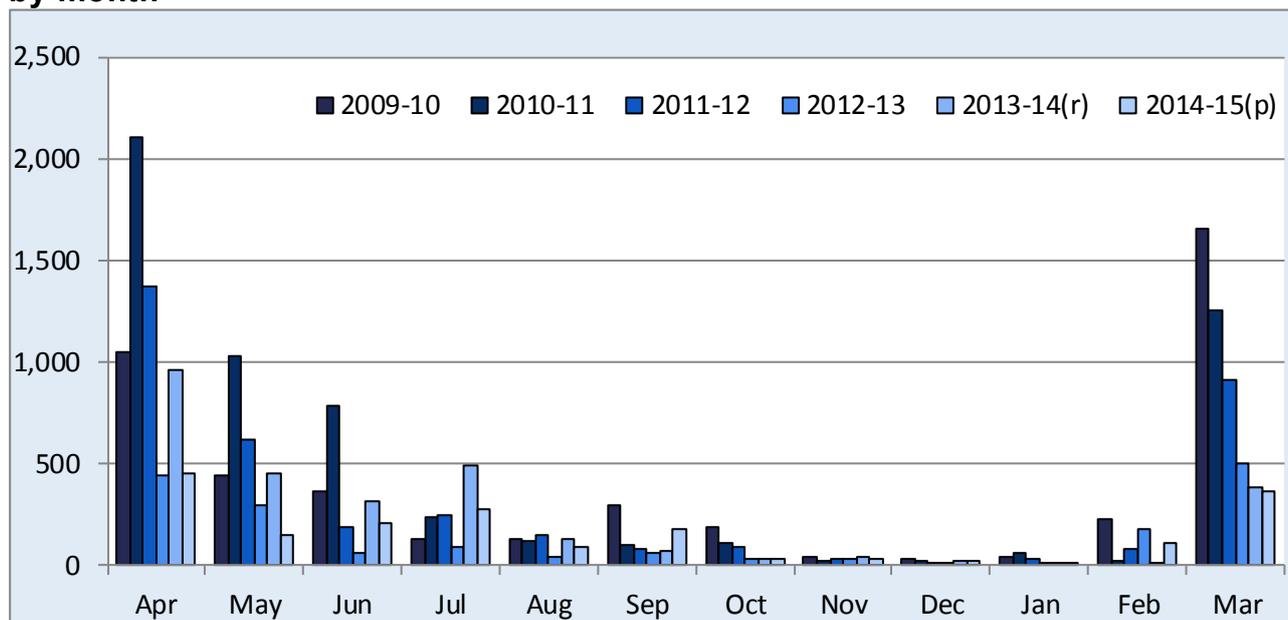

(c) Other outdoors includes the following locations: loose refuse, river/canal, lake/pond/reservoir, sea, road surface/pavement, railway, airfield/runway, cycle path/public footpath/bridleway, cemetery, park, beach, landfill site, wasteland, mines and quarries (excluding buildings above ground), golf course, playground (excluding equipment)/recreational area.

(r) Revised data.

(p) Provisional data.

Fires on grassland, woodland or crops accounted for 37 per cent of deliberate secondary fires in 2014-15 and numbers of these fires decreased by 34 per cent compared with the previous year. The chart below shows the peaks for these fires tend to occur in April, May and March, and since 2009-10 these 3 months have accounted for almost 70 per cent of the deliberate secondary fires on grassland, woodland and crops. However in 2014-15 these months only accounted for around half of the fires. It is likely that the weather and consequential environmental conditions will have been responsible in some part for the fluctuations in the numbers of outdoor fires.

Chart 10: Number of deliberate secondary grassland, woodland and crop fires by month

(r) Revised data.

(p) Provisional data.

Over the time series the peaks for these fires have typically occurred in the spring months of April and March. In recent years the proportion occurring in these months has decreased, from almost 60 per cent in 2009-10 to 42 per cent in 2014-15. Conversely the proportion occurring in June and July have risen, from just over 10 per cent in 2009-10 to 25 per cent in 2014-15.

Analysis of weather data from the Met Office shows that April 2014 saw 7 per cent fewer hours of sunshine and 46 per cent more rainfall compared with April 2013; the number of deliberate grassland, woodland and crop fires fell by 53 per cent between April 2013 and April 2014. For March 2015, the number of deliberate grassland, woodland and crop fires fell by 7 per cent (compared with March 2014), saw 3 per cent fewer hours of sunshine and 23 per cent more rainfall.

The number of these fires more than doubled in September 2014 compared with the previous year, from 70 in 2013-14 to 180 in 2014-15. In this month there was 46 per cent more hours of sunshine in comparison with the previous year and 78 per cent less rainfall.

Numbers of fires in February has fluctuated over the years, with a peak of 228 in 2009-10 and a low of 9 in 2013-14. These dates coincide with a drier than average (2009-10 to 2014-15) February in 2010, and the third wettest February since 1910 in 2015.

Further data on this topic is available on StatsWales:

<https://statswales.wales.gov.uk/Catalogue/Community-Safety-and-Social-Inclusion/Community-Safety/Fire-Incidents/Fires-and-False-Alarms>

Met Office data are available from:

<http://www.metoffice.gov.uk/climate/uk/summaries/datasets>

Section 4: Casualties and rescues

4.1 Fatal casualties from fires

A fatal casualty is defined as a person whose death is attributed to a fire, even if the death occurred weeks or months later.

Provisional figures show there were 21 fatal casualties during 2014-15 (see table 8). The overall trend in fatalities since 2001-02 has been downward, although since 2008-09 the number has varied between 17 and 23. In 2014-15 the fatality rate per million population (pmp) was lowest in South Wales at 4.7 pmp.

Table 8: Number and rate of fatal casualties from fires by Fire and Rescue Service

	North Wales		Mid and West Wales		South Wales		Wales	
	Number	pmp (a)	Number	pmp (a)	Number	pmp (a)	Number	pmp (a)
2001-02	15	22.6	13	15.4	10	7.1	38	13.1
2002-03	8	12.0	9	10.6	8	5.7	25	8.6
2003-04	7	10.5	13	15.2	13	9.2	33	11.2
2004-05	4	5.9	10	11.6	13	9.2	27	9.1
2005-06	9	13.4	6	6.9	9	6.3	24	8.1
2006-07	14	20.7	2	2.3	4	2.8	20	6.7
2007-08	7	10.3	9	10.2	12	8.3	28	9.3
2008-09	3	4.4	5	5.6	9	6.2	17	5.6
2009-10	8	11.7	11	12.4	4	2.7	23	7.6
2010-11	10	14.6	7	7.9	4	2.7	21	6.9
2011-12	8	11.6	8	9.0	7	4.7	23	7.5
2012-13	8	11.6	3	3.3	6	4.0	17	5.5
2013-14 (r)	3	4.3	8	8.9	6	4.0	17	5.5
2014-15 (p)	6	8.6	8	8.9	7	4.7	21	6.8

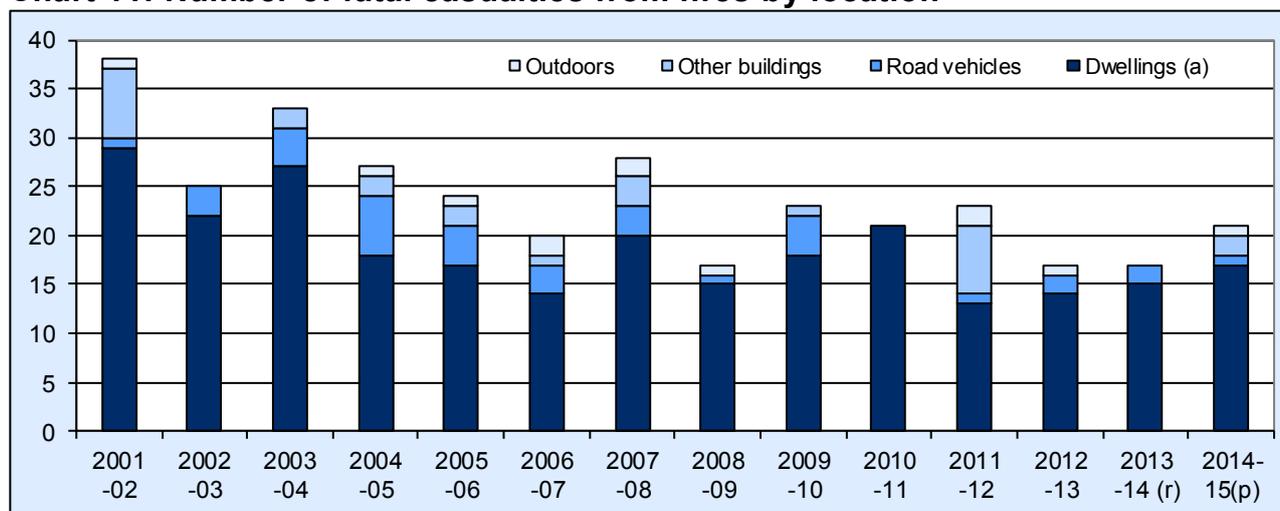

(a) Per million population. Population data are taken from ONS Mid Year Estimates and are revised periodically and so rates are subject to change between publications.

(r) Revised data.

(p) Provisional data.

Since 2001-02, 78 per cent of fatal casualties occurred in dwelling fires, equating to a total of 260 out of 334 fatalities. Around 4 in 5 fatalities occurring in 2014-15 were the result of dwelling fires.

Chart 11: Number of fatal casualties from fires by location

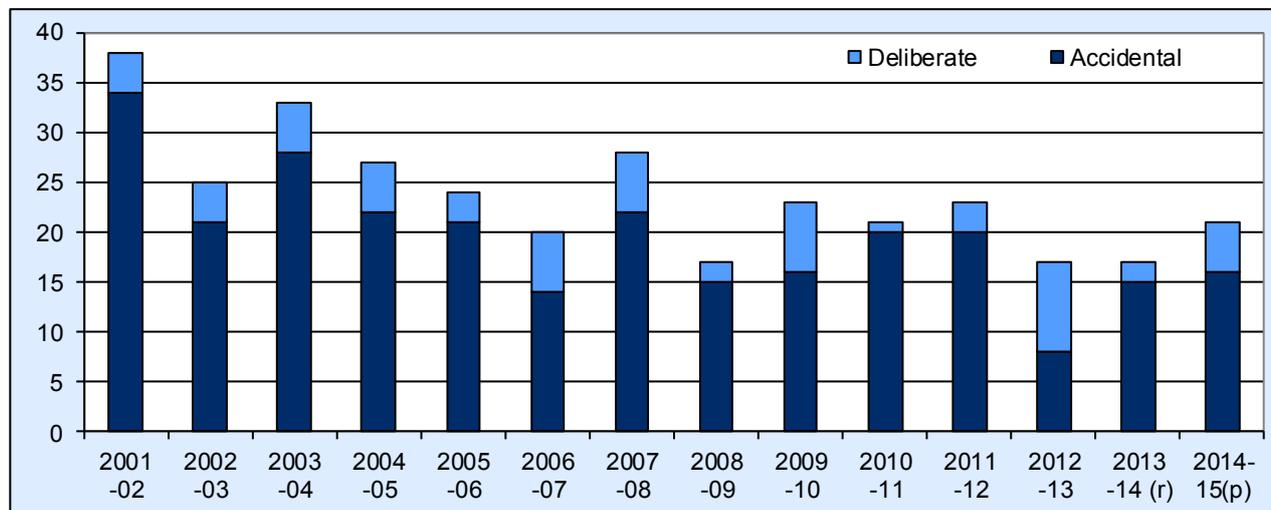

(a) Includes caravans, houseboats and other non-building structures used solely as a permanent dwelling.

(r) Revised data.

(p) Provisional data.

In 2014-15 16 fatalities were the result of accidental fires with 13 of these occurring in dwellings. There were 5 fatalities as the result of deliberate fires, 4 in dwelling fires and 1 in a road vehicle fire.

Chart 12: Number of fatal casualties from fires by motive

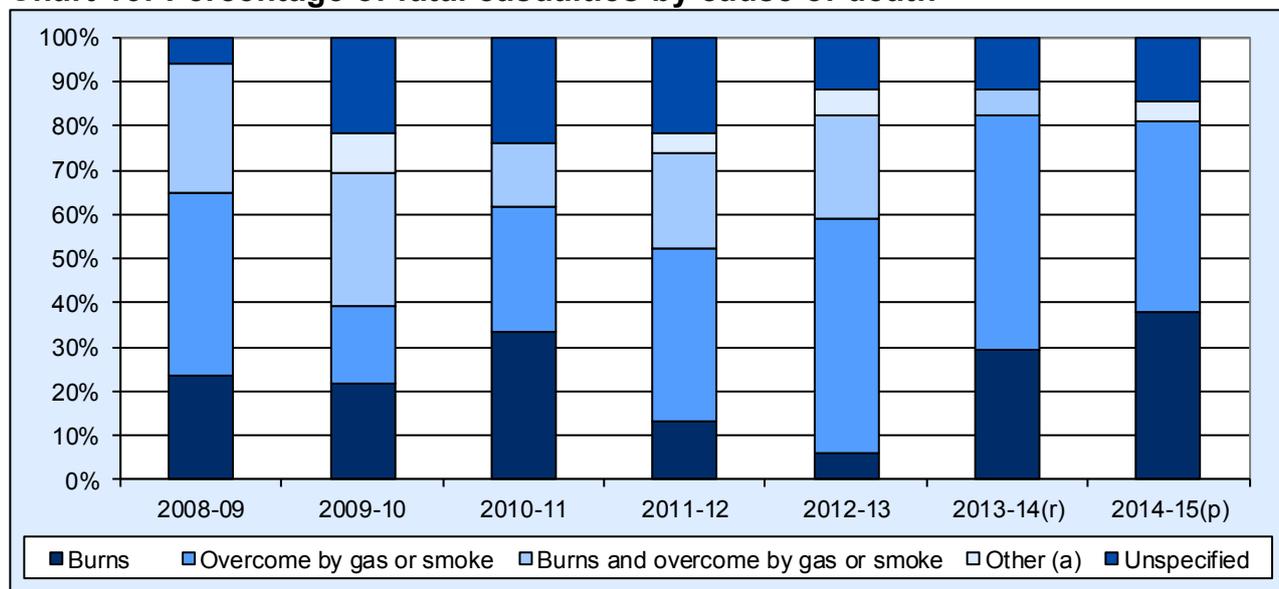

(r) Revised data.
(p) Provisional data

During 2014-15 the two main causes of death from fires in Wales were being 'overcome with smoke or gas' and 'burns'. Being overcome by smoke or gas accounted for 9 fatalities in 2014-15, and burns were responsible for 8.

Since 2001-02 being overcome by smoke or gas has accounted for 46 per cent of fatalities, burns accounted for 22 per cent of fatalities and a combination of the two caused 19 per cent of fatalities.

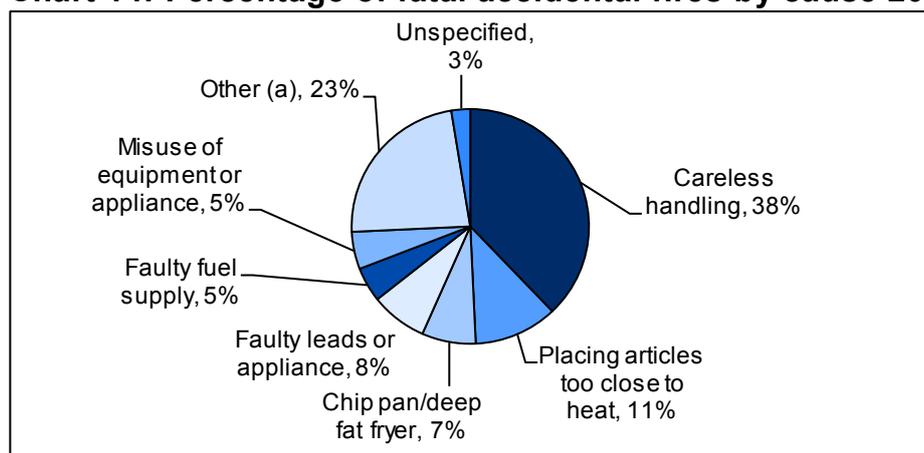

Chart 13: Percentage of fatal casualties by cause of death

(a) Other includes cardiac arrests and other physical injuries.
(r) Revised data.
(p) Provisional data.

Of the 272 fatalities occurring in accidental fires from 2001-02 to 2014-15, in 38 per cent of fires the cause of the fire was recorded as 'careless handling', causes of fires are looked at in more detail in Section 7. Between 2001-02 and 2014-15, 20 fatalities (7 per cent) were in fires caused by chip or deep fat fryers.

Chart 14: Percentage of fatal accidental fires by cause 2001-02 to 2014-15

(a) Other Includes playing with fire and causes listed as 'other'.

4.2 Non-fatal casualties from fires

From April 2009 non-fatal casualties are recorded as being in one of four classes of severity as follows:

- (i) Victim went to hospital, injuries appear to be serious
- (ii) Victim went to hospital, injuries appear to be slight
- (iii) First aid given at scene
- (iv) Precautionary check recommended – this is when an individual is sent to hospital or advised to see a doctor as a precaution, having no obvious injury or distress.

Due to these changes and the introduction of a 'fire-related injury' marker there is a possible discontinuity in the number of non-fatal casualties, further information on this is available in the Quality Information section.

In 2014-15, South Wales had the lowest rate of non-fatal casualties per million population. The overall trend in the non-fatal casualty rate has been downward, although in 2013-14 the rate saw a notable jump to its highest level since 2008-09, which was driven by a rise in the number of those advised to have precautionary checks and first aid cases.

Table 9: Number and rate of non-fatal casualties from fires by Fire and Rescue Service

	North Wales		Mid and West Wales		South Wales		Wales	
	Number	pmp (a)	Number	pmp (a)	Number	pmp (a)	Number	pmp (a)
2001-02	210	316.0	300	354.5	423	302.3	933	320.6
2002-03	199	298.4	270	317.2	393	279.7	862	294.9
2003-04	170	254.0	293	341.6	366	259.5	829	282.2
2004-05	213	316.8	222	256.8	360	253.4	795	268.8
2005-06	191	283.7	238	274.1	330	231.1	759	255.6
2006-07	179	264.8	167	191.2	286	199.1	632	211.7
2007-08	209	307.6	178	202.3	245	169.3	632	210.2
2008-09	208	304.7	149	168.3	300	205.7	657	217.1
2009-10	234	341.8	158	178.1	183	124.7	575	189.2
2010-11	281	409.7	132	148.3	194	131.6	607	199.0
2011-12	228	331.2	184	205.9	180	121.5	592	193.2
2012-13	213	308.5	151	168.5	177	119.0	541	176.0
2013-14 (r)	276	398.9	167	186.2	183	122.5	626	203.1
2014-15 (p)	194	279.5	194	215.9	155	103.4	543	175.6

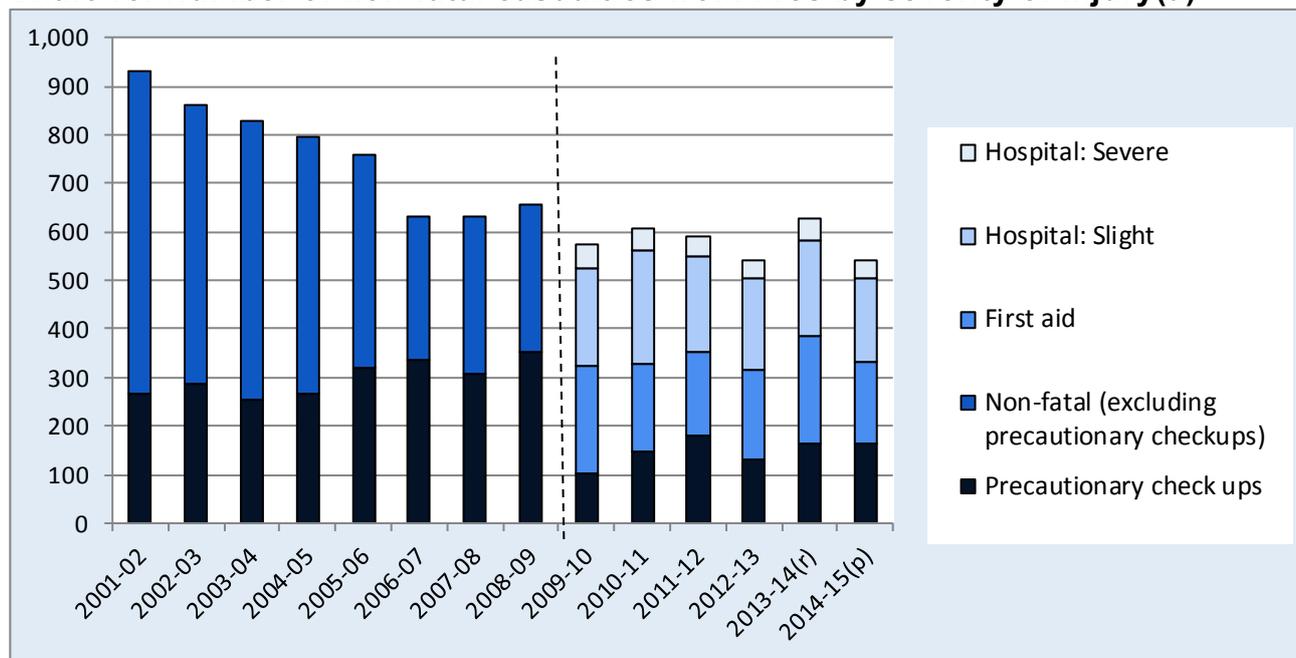

(a) Per million population. Population data are taken from ONS Mid Year Estimates revised periodically and so rates are subject to change between publications.

(r) Revised data

(p) Provisional data.

543 non-fatal casualties were recorded in 2014-15, a decrease of 13 per cent compared with the previous year. The decrease follows a similar increase in the previous year and on both occasions the change was driven by the numbers of those advised to have precautionary checks and first aid cases, the number of these cases falling by 13 per cent in 2014-15 compared with the previous year. In 2014-15, 62 per cent of non-fatal casualties received first aid or were advised to have a precautionary check-up. 32 per cent of non-fatal casualties were taken to hospital with slight injuries and the remaining 7 per cent were taken to hospital with severe injuries.

Chart 15: Number of non-fatal casualties from fires by severity of injury(a)

(a) The introduction of IRS in 2009-10 led to a change in the way non-fatal casualties were recorded and a possible discontinuity, notably in the number of those receiving precautionary checks. See the 'Comparability' section in Section 11- Data Quality for further information.

(r) Revised data.

(p) Provisional data.

After those given first aid and precautionary check-ups the next largest category of casualties were those treated for being overcome by gas or smoke, accounting for 14 per cent of all non-fatal casualties, whilst 12 per cent had burns.

Of the 543 non-fatal casualties, 420 (77 per cent) were the result of in dwelling fires, 47 (9 per cent) in other buildings, 45 (8 per cent) from road vehicle fires and 31 (6 per cent) in outdoor fires.

Most non-fatal casualties (92 per cent) were from accidental fires and 71 per cent were the result of accidental dwelling fires. 6 per cent of non-fatal casualties in 2014-15 came from deliberate dwelling fires.

Cooking (excluding chip pans) was the largest single cause of non-fatal casualties in accidental fires in 2014-15 (21 per cent). Chip pan related casualties accounted for 13 per cent of those in accidental fires.

4.3 Non-fatal casualties (excluding precautionary check-ups) from fires

In 2014-15, 209 non-fatal casualties were sent to hospital, a decrease of 14 per cent compared with the previous year. Of these 209 non-fatal casualties, 87 per cent in all were from accidental fires; 57 per cent occurred in accidental fires in dwellings.

Excluding those sent for precautionary checks and those given first aid, the most common injury was 'being overcome with smoke or gas' relating to 77 non-fatal casualties and 37 per cent of those sent to hospital. This has been the most common injury for casualties sent to hospital since 2009-10, accounting for 43 per cent of all non-fatal casualties sent to hospital since this time. There were 65 casualties in 2014-15 with burns, accounting for 31 per cent of those sent to hospital.

4.4 Rescues from fires

In 2014-15, 212 people were rescued from fires, 82 (39 per cent) of whom were not injured, 11 were fatalities (rescued but later died from fire-related injuries) and 119 were non-fatal casualties. This is a 13 per cent decrease in the number of rescues compared with the previous year, due to a fall in the number of those rescued though uninjured.

In 2014-15, the majority (89 per cent) of rescues (including those injured) from fires were from dwelling fires, a further 6 per cent were rescued from other buildings, 5 per cent from road vehicles and 1 per cent from outdoor locations.

Total rescued	188	12	10	2	212

(a) Includes casualties where it is unknown whether they were rescued.

(r) Revised data.

(p) Provisional data.

In 2014-15, 57 per cent of those rescued were male and 43 per cent were female. 40 per cent of those rescued were aged between 30 and 59, whilst 29 per cent were aged 60 or over.

For those rescued from fires but not injured, males accounted for 55 per cent (females accounted for 45 per cent). People aged between 30 and 59 accounted for a third of those who were rescued but non-injured.

Section 5: False alarms

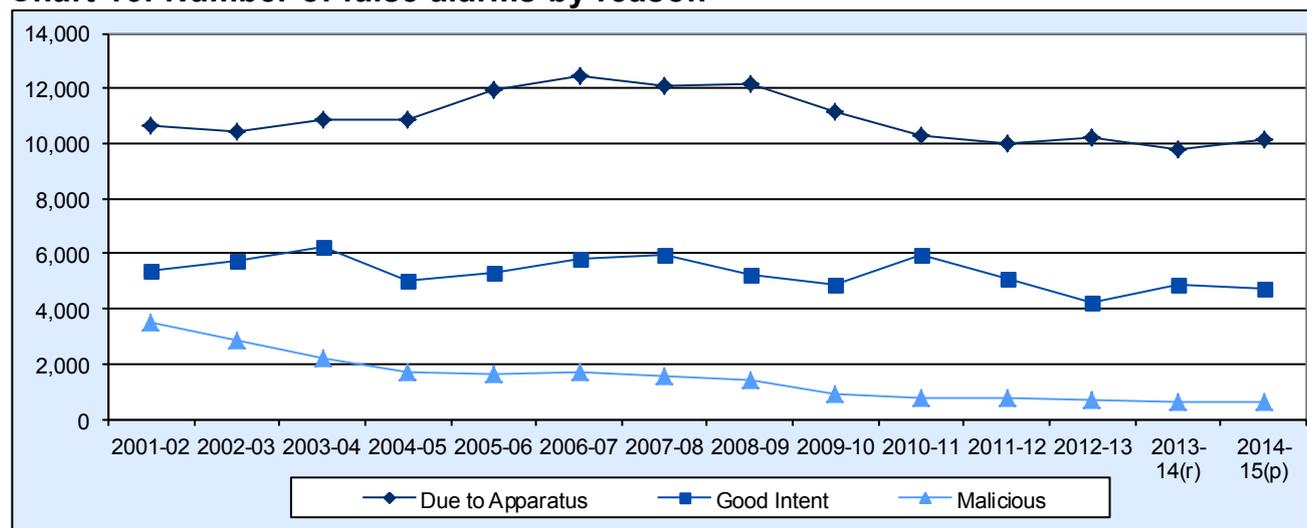

A false alarm is defined as an event in which the Fire and Rescue Service believes they are called to a reportable fire and then find there is no such incident. False alarms are categorised as follows:

- Malicious** where the call is deliberately for a non-existent fire-related event
- Good intent** in which the call was made in good faith in the belief that there was a fire to attend
- Due to apparatus** in which the call was initiated by the operation of fire alarm and fire-fighting equipment

In 2014-15 there were 15,482 false fire alarms in Wales, up from 15,312 in 2013-14, an increase of 1 per cent, following a similar increase in the previous year. Since 2001-02 the number of false alarms attended has fallen by 21 per cent. FRSs suggest successful call challenging is a factor in this long-term fall (information taken from internal call logging systems).

The increase in the number of false alarms in 2014-15 is due to a rise in the number of those caused by apparatus. In 2014-15 there were 333 more false alarms due to apparatus than in the previous year, equating to a 3 per cent increase (although still the third lowest figure in the time series shown below). Reasons for false alarms due to apparatus are explored in greater detail in table 14. Both numbers of malicious false alarms and good intent false alarms fell in 2014-15, by 6 per cent and 3 per cent respectively.

Chart 16: Number of false alarms by reason

(r) Revised data.

(p) Provisional data.

Overall there has been a downward trend in the number of malicious false alarms, falling by 83 per cent since 2001-02. In 2014-15 the number decreased by 6 per cent. North Wales and South Wales saw no change in the number of malicious false alarms, whilst Mid and West Wales saw a decrease of 25 per cent.

Table 12: Number of malicious false alarms by Fire and Rescue Service

	North Wales	Mid and West Wales	South Wales	Wales

(a) Includes caravans, houseboats and other non-building structures used solely as a permanent dwelling.

(r) Revised data.

(p) Provisional data.

False alarms in 'other buildings' accounted for 47 per cent of false alarms in 2014-15, the majority of which (91 per cent) were due to apparatus. A breakdown of more detailed reasons is given in table 14.

Almost two thirds of false alarms in dwellings were due to apparatus, and 3 in 10 were raised with good intent.

Most (95 per cent) 'other outdoors' false alarms were due to good intent, and these were mainly (68 per cent) as a result of controlled burning.

In 2014-15, 37 per cent of false alarms due to apparatus (in buildings) were the result of human causes, with cooking causing over 2,100 of these false alarms (21 per cent of false alarms due to

apparatus). Human factors triggered a greater proportion of false alarms in dwellings than in other buildings (47 per cent and 32 per cent respectively).

Problems with safety systems (faulty, damaged, poorly maintained and poorly sited) also caused a large number of false alarms in buildings, accounting for 37 per cent.

A further 18 per cent were the result of contaminants getting into the system. Contaminants (for example insects, dust and steam) were a bigger problem in other buildings than in dwellings, causing a more than a fifth of false alarms due to apparatus, but around a tenth of those in dwellings.

Table 14: Number of false alarms due to apparatus in buildings by detailed reason

Section 6: Smoke alarms

This section looks at fires in dwellings attended by the Fire and Rescue Service and the effectiveness of smoke alarms. Any fires involving alarms where no emergency call was made to the Fire and Rescue Service will not be recorded, and therefore the figures reported should understate the effectiveness of smoke alarms.

Some buildings have multiple smoke alarms and so in this section some tables and charts refer to numbers of fires whilst others refer to numbers of smoke alarms. Chart 17, table 17, chart 18 and chart 19 refer to numbers of fires. In these charts and tables, the following hierarchy has been applied to the smoke alarm operation:

1. Present, operated and raised the alarm
2. Present, operated but didn't raise alarm
3. Present but didn't operate

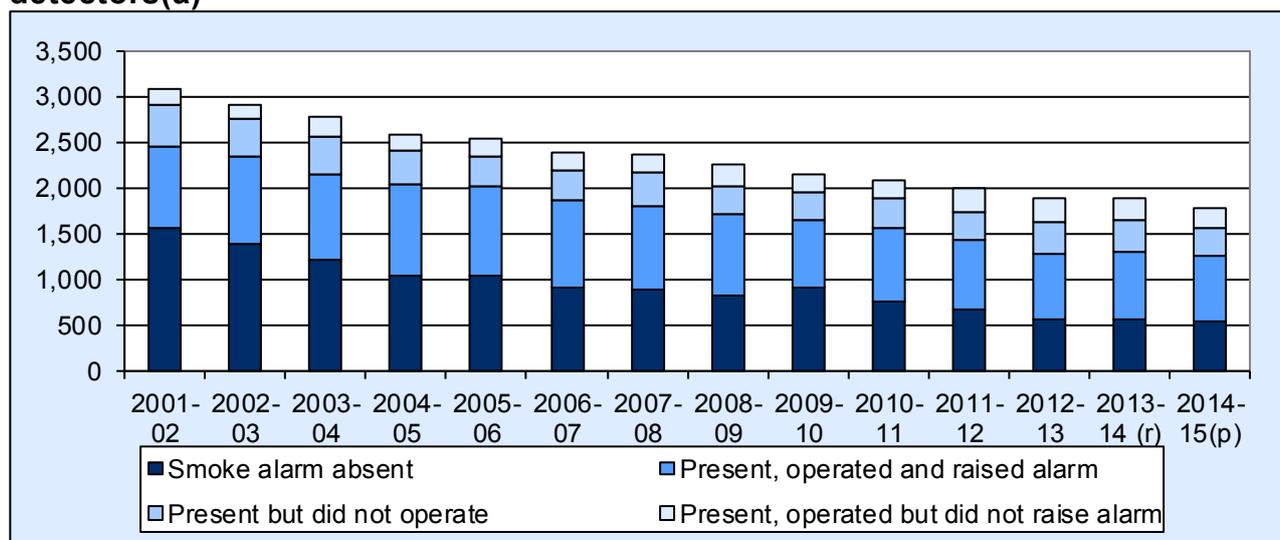

Therefore an alarm which operated and raised the alarm 'outranks' one which operated but didn't raise the alarm and so on. In many cases the reason a smoke alarm that operates does not raise the alarm is that the alarm has already been raised prior to the operation of this smoke alarm. (See table 15)

Table 15 and table 16 refer to the number of smoke alarms as they focus on the reason for failing to raise the alarm.

A smoke alarm was present and operated correctly in around half of fires in dwellings occurring in 2014-15. In a further 17 per cent of cases a smoke alarm was present but failed to operate, whilst in 30 per cent of dwelling fires a smoke alarm was absent. For context, approximately 94 per cent of all households in Wales had at least one smoke alarm (National Survey for Wales 2013-14¹³) and of these 98 per cent had at least one working smoke alarm. For each FRS the proportions of households with at least one smoke alarm and of these at least one working smoke alarm were as follows: North Wales (96 per cent and 98 per cent), Mid and West Wales (94 per cent and 98 per cent) and South Wales (94 per cent and 97 per cent).

In 2 per cent of dwelling fires it was unknown whether there was a fire alarm. Reasons for the smoke detector not operating or raising the alarm are explored in tables 15 and 16.

Chart 17: Number of fires in dwellings by presence and operation of smoke detectors(a)

(a) Dwellings include caravans, houseboats and other non-building structures used solely as a permanent dwelling.

(r) Revised data.

(p) Provisional data

¹³ <https://stats.wales.gov.uk/Catalogue/National-Survey-for-Wales/2013-14>

Since 2009-10, 24 of the 81 accidental dwelling fire fatalities occurred in fires where no smoke alarm was known to be absent. 23 fatalities occurred in accidental dwelling fires where a smoke alarm was present and raised the alarm.

The table below shows the number of smoke alarms which were present and operated at building fires but did not raise the alarm and the reasons for this. It includes multiple alarms in buildings which behaved in this way and so does not equate to numbers of dwellings and other building fires.

In 2014-15 there were almost 200 smoke alarms which activated but did not raise the alarm due to the alarm having already been raised. This equates to over two-thirds of the smoke alarms in which did not raise the alarm. This has consistently been the most common reason for a smoke alarm failing to raise the alarm in spite of being activated in the available time series (since 2009-10).

In 2014-15, 16 per cent these of smoke alarms did not raise the alarm due to no one being in earshot.

Table 15: Number of smoke alarms, which were present at building fires but did not raise alarm, by reason

(r) Revised data.

(p) Provisional data

The table below includes multiple smoke alarms at building fires which did not activate and so does not equate to the number of dwelling and other building fires.

In 2014-15 the main reason for smoke alarm failures, in both dwellings and other buildings, was that the fire was not close enough to the detector (49 per cent of the smoke alarms which failed to activate in building fires). Defective or missing batteries accounted for 11 per cent of alarm failures in building fires in 2014-15.

Table 16: Number of smoke alarms present in fires in buildings, which did not activate by reason

	2009-10	2010-11	2011-12	2012-13	2013-14(r)	2014-15(p)

(r) Revised data.

(p) Provisional data.

Table 17 shows that the number of dwellings fires where a smoke alarm was absent decreased by 6 per cent to 541 in 2014-15 compared with 573 in 2013-14. Since 2001-02 the number of dwelling fires where there was no smoke alarm has fallen by 65 per cent.

In 2014-15, both North Wales and Mid and West Wales saw decreases in the number of dwelling fires where smoke alarms were absent (compared with the previous year). Over the same period, South Wales saw an increase in dwelling fires where a smoke alarm was absent.

Table 17: Number of fires in dwellings where smoke alarm was absent, by Fire and Rescue Service (a)

(a) Dwellings include caravans, houseboats and other non-building structures used solely as a permanent dwelling.

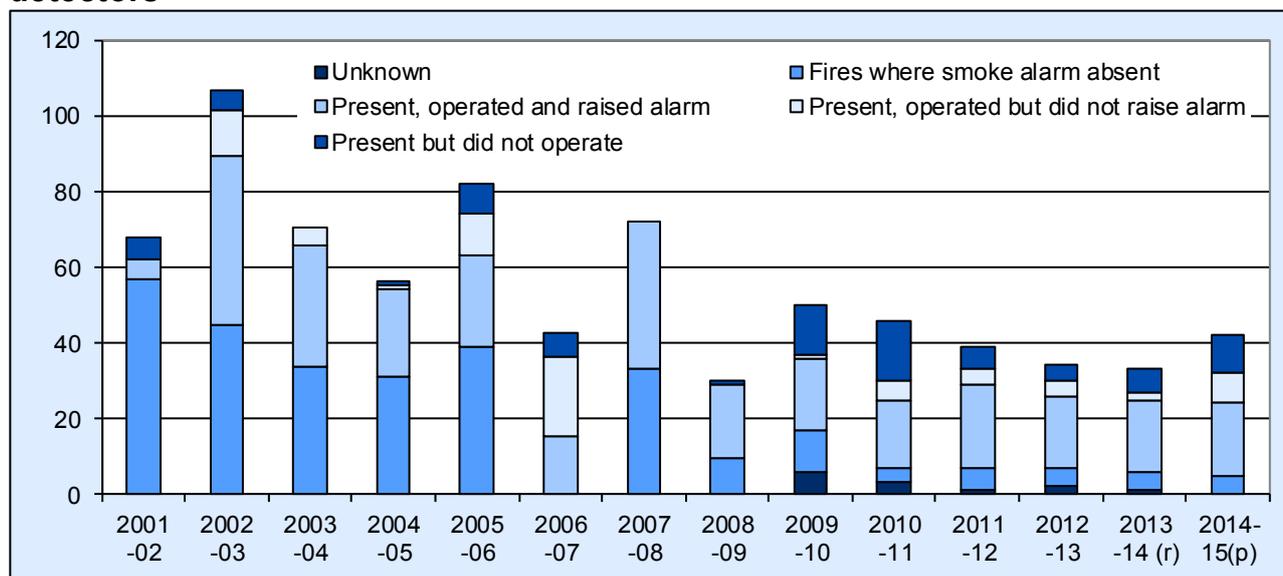

(r) Revised data.

(p) Provisional data.

6.1 Smoke alarms in fires at schools

Of the 42 fires occurring in schools in 2014-15 a smoke alarm was present and operated correctly in 64 per cent of incidents, whilst in a further 24 per cent of cases a smoke alarm was present but failed to operate. In 12 per cent of school fires a smoke alarm was absent.

Chart 18: Number of fires in schools by presence and operation of smoke detectors

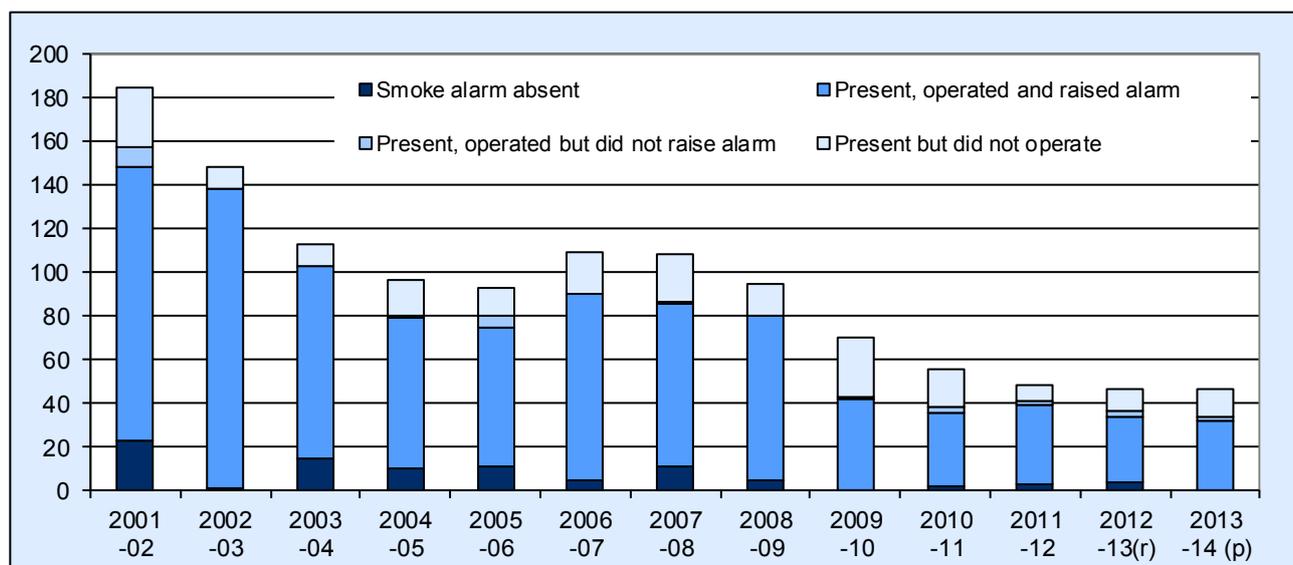

(r) Revised data.

(p) Provisional data.

6.2 Smoke alarms in fires at hospitals

In 2014-15 there were 52 fires in hospitals, a fall of 72 per cent compared with the number in 2001-02. A smoke alarm was present and operated correctly in 6 in 10 fires in hospitals in 2014-15. In 3 in 10 of hospital fires a smoke alarm was present but failed to operate and in 1 in 10 a smoke alarm was absent.

Chart 19: Number of fires in hospitals by presence and operation of smoke detectors

(r) Revised data.

(p) Provisional data.

37 of the 52 hospital fires occurring in 2014-15 were accidental.

Since 2009-10 there have been no fatalities and 5 non-fatal casualties in hospital fires.

Further data is available on this topic on StatsWales:

<https://statswales.wales.gov.uk/Catalogue/Community-Safety-and-Social-Inclusion/Community-Safety/Fire-Incidents/Smoke-Alarms>

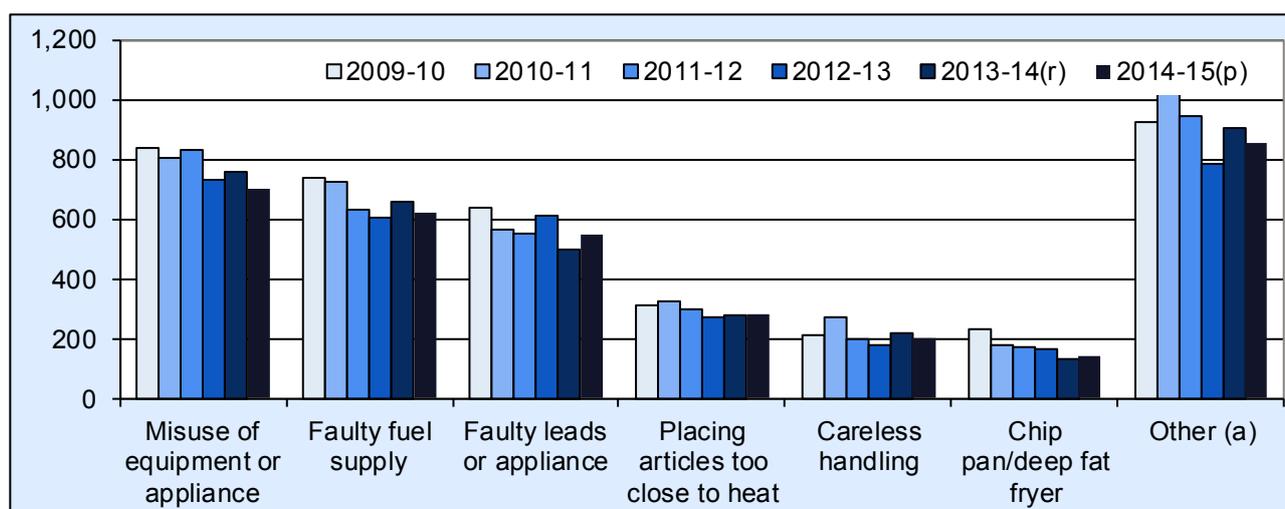

Section 7: Cause of fires

This section relates to the physical cause or action (whether human, mechanical or natural) leading to the fire, and the source of the flame, spark or heat that first ignited the fire. This information is only collected for primary fires.

7.1 Cause of accidental fires

In 2014-15 the largest single cause of accidental fires was misuse of equipment or appliances, equating to 21 per cent. Faulty fuel supplies (19 per cent) and faulty leads or appliances (16 per cent) were the next largest causes of accidental fires in this year. 'Other accidental' accounted for 25 per cent of accidental fires.

Chart 20: Number of accidental primary fires by cause

(a) 'Other' includes 'Accumulation of flammable material', 'Bonfire going out of control', 'Chimney fire', 'Natural occurrence', 'Other', 'Other intentional burning, going out of control', 'Overheating, unknown cause', 'Person too close to heat source (or fire)', 'Playing with fire (or heat source)', 'Vehicle crash or collision'.

(a) 'Other' includes 'Accumulation of flammable material', 'Bonfire going out of control', 'Chimney fire', 'Natural occurrence', 'Other', 'Other intentional burning, going out of control', 'Overheating, unknown cause', 'Person too close to heat source (or fire)', 'Playing with fire (or heat source)', 'Vehicle crash or collision'.

(r) Revised data.

(p) Provisional data.

The misuse of equipment or appliances was also the main cause of accidental fires in dwellings, with 594 cases recorded in 2014-15. This is 36 per cent of accidental dwelling fires and a decrease of 10 per cent compared with 2013-14. The majority (84 per cent) of those accidental fires in dwellings recorded as being caused by the misuse of equipment or appliances were due to 'cooking' (excluding the use of chip pans and deep fat fryers).

(p) Provisional data.

7.2 Source of ignition in accidental fires

Cooking appliances have consistently been recorded as the main cause of accidental fires. In 2014-15 there were 969 cases relating to 29 per cent of accidental fires, a similar proportion to that seen in earlier years. However the number of fires caused by cooking appliances has fallen, by 48 per cent compared with 2001-02 and 4 per cent compared with 2013-14.

Chart 22: Number of accidental fires by source of ignition

(a) 'Other' includes 'Bombs and explosives', 'Chimney', 'Fireworks', 'Fuel/Chemical', 'Heating equipment', 'Industrial equipment', 'Naked flame', 'Natural occurrence', 'Oil and Incense burners', 'Other', 'Gardening equipment', 'Spread from secondary fire', 'Wet hay', 'Vehicle related' and other electrical appliances where the power source is not recorded as electrical.

(r) Revised data.

(p) Provisional data.

In 2014-15 there were 7 fatalities and 53 non-fatal casualties in accidental fires which were attributable to smokers' materials, the number of fires remained around the same number. Since 2009-10 almost 3 in 10 of all fatalities were the result of accidental fires caused by smokers' materials. In November 2011, a new EU directive required cigarettes to meet a reduced ignition propensity (RIP) requirement, they are now manufactured to be self-extinguishable, reducing the chance that they should set fire to combustible materials. However we are not able to determine how many of the fires ignited by "smokers' materials" are related to cigarettes.

Table 20: Number of accidental fires by source of ignition

	Smokers materials	Matches and candles	Cooking appliances	Space heating appliances	Central and water heating appliances	Blow lamps, welding and cutting equipment	Electrical distribution	Other electrical appliances	Other (a)	Unspecified

(r) Revised data.

(p) Provisional data.

Cooking appliances were the main source of ignition in accidental dwelling fires accounting for more than half of accidental dwelling fires in 2014-15. However the number of these fires has fallen by 44 per cent since 2001-02. Fires ignited by cooking appliances have also been responsible for 55 per cent of non-fatal casualties in accidental dwelling fires since 2009-10. In 2014-15 almost all categories of ignition source saw decreases in the number of fires when compared with the previous year.

(p) Provisional data.

Further data is available on this topic on StatsWales:

<https://statswales.wales.gov.uk/Catalogue/Community-Safety-and-Social-Inclusion/Community-Safety/Fire-Incidents/Fires-and-False-Alarms/AccidentalPrimaryFires-by-Cause-SourceIgnition>

Section 8: Response times

The Response times presented here are based on comparisons between the time that the first vehicle was mobilised and the first vehicle arrived at the scene. This may not be the same vehicle. The urban geography of the area covered by South Wales FRS is likely to be the cause of the apparent faster response times to fires. Both North Wales and Mid and West Wales FRSs cover large areas of rural and agricultural land. The nature of the road network in these rural areas is likely to be another factor affecting the response times.

Further information about the geography, number of fires stations and population of each FRS are provided in the Quality Information Section.

In 2014-15 around three-fifths of primary fires attended in North Wales had a response time of between 1 and 10 minutes. Two-thirds of those in Mid and West Wales and four-fifths in South Wales were attended within 10 minutes.

Table 24: Percentage of primary fires attended within specified time brackets (a)

	Between 1 and 5 minutes	Between 5 and 10 minutes	Between 10 and 15 minutes	Greater than 15 minutes
Primary fires				
2009-10				
North Wales	13	52	23	12
Mid and West Wales	19	52	19	9
South Wales	23	57	16	4
Wales	19	55	18	7
2010-11

North Wales	14	48	24	14
Mid and West Wales	15	52	20	13
South Wales	22	56	17	5
Wales	18	53	20	10

(a) This analysis is based on comparisons between the first vehicle was mobilised and the time the first vehicle arrived at the scene. Excluded are late calls, incidents with only heat and smoke damage and response times less than 1 minute or over one hour. 2 per cent of primary fires in 2011-12 were excluded due to the response time being less than 1 minute or over 1 hour. In the other years shown 1 per cent for primary fires were excluded for this reason.

(r) Revised data.

(p) Provisional data.

In 2014-15 around 7 in 10 primary dwelling fires attended in Mid and West Wales had a response time of between 1 and 10 minutes; in North Wales almost three-quarters were attended in this time. 84 per cent of primary dwelling fires in South Wales were attended within 10 minutes.

(r) Revised data.

Section 9: Great Britain comparisons

At the time of publication 2014-15 data were not available for England or Scotland.

In 2013-14 the total number of fires attended increased by 11 per cent in England, 5 per cent in Scotland and 15 per cent in Wales. In 2014-15 the number of fires in Wales fell by 12 per cent. Primary fires in Wales in 2013-14 saw a small increase (1 per cent) whereas the number in England and Scotland fell (by 2 per cent and 5 per cent respectively).

Secondary fires in England, Scotland and Wales increased in 2013-14, by 27 per cent, 15 per cent and 32 per cent respectively. Weather conditions are likely to have been a major factor in this increase, see Section 3 for more analysis. In 2014-15 the number of secondary fires in Wales fell by 16 per cent.

(p) Provisional data.

~ Data not available yet.

The fatality and non-fatal casualty rates per million population were lowest in England in 2013-14, and this is true for most years in the time series shown. Scotland has had the highest casualty and fatality rates for the published time series, however the fatality rate in Wales increased from 5.5 in 2013-14 to 6.8 in 2014-15. This is the highest rate for Wales since 2011-12.

(a) English data are taken from 'Fire statistics monitor: April 2013 to March 2014':

<https://www.gov.uk/government/publications/fire-statistics-monitor-april-2013-to-march-2014>

(b) Scottish data for 2012-13 is currently provisional. Scottish data are taken from 'Fire Statistics Scotland, 2012-13':

<http://www.scotland.gov.uk/Publications/2013/10/5284/0>

(c) Per million population. Population data are taken from ONS Mid Year Estimates revised periodically and so rates are subject to change between publications.

(r) Revised data for England and Wales.

(p) Provisional data.

~ Data not available yet.

Section 10: Glossary

Accidental fires include those where the cause was not known or unspecified.

Buildings are defined as all buildings including those under construction, but excluding derelict buildings, or those under demolition. Prior to 1994 'buildings' were referred to as 'occupied buildings'.

Cause of fire is the defect, act or omission leading to ignition of the fire.

Chimney fires are any fires in occupied buildings where the fire was confined within the chimney structure (and did not involve casualties or rescues or attendance by five or more appliances).

Deliberate fires include those where deliberate ignition is merely suspected.

Dwellings are defined as buildings occupied by households, excluding hotels, hostels and residential institutions. From 1988, mobile homes have been specifically included in the dwelling count. In 2000, the definition of a dwelling was widened to include any non-permanent structures used solely as a dwelling, such as houseboats. All analyses from 1994 to 1998 relating to dwellings were retrospectively revised to include the new categories of dwellings.

False Alarms are events in which the Fire and Rescue Service believes they are called to a reportable fire and then find there is no incident. False alarms are categorised as follows:

- **Malicious False Alarms** are calls made with the intention of getting the fire and rescue service to attend a non-existent fire-related event, including deliberate and suspected malicious intentions.
- **Good Intent False Alarms** are calls made in good faith in the belief that the fire and rescue service really would attend a fire.
- **False Alarms Due to Apparatus** are calls initiated by fire alarm and fire-fighting equipment operating (including accidental initiation of alarm apparatus by persons).

Fatal Casualty is a person whose death is attributed to a fire even if the death occurred weeks or months later. There are also occasional cases where it transpires subsequently that fire was not the cause of death. The figures for fatalities are thus subject to revision.

Fire Data Reports (FDR1 and FDR3) were the method of data collection via paper forms prior to the Incident Recording System (introduced in April 2009). FDR1 was used to record primary fires, FDR3 for secondary fires, chimney fires and false alarms.

Fire and Rescue Services (FRS) are the three regions (North Wales, Mid and West Wales and South Wales) into which Wales is divided in relation to the fire service.

Heat or smoke damage only incidents are reportable fires where there is no flame damage. The damage reported may be due to any combination of heat, smoke and other which will include any water damage.

Incident Recording System (IRS) is the electronic based system for recording fires, false alarms and Special Service Incidents. IRS replaced the FDR1 and FDR3 paper forms in April 2009.

Late fire call is a fire known to be extinguished when the call was made (or to which no call was made, e.g. a fire which comes to the attention of the Fire and Rescue Service) and which the Fire and Rescue Service attended.

Location is the type of premises, property or countryside in which the fire started. This is not necessarily the type of premises in which most casualties or damage occurred as a result of the fire.

Non-fatal casualties are recorded as being in one of four classes of severity as follows:

- (i) Victim went to hospital, injuries appear to be serious
- (ii) Victim went to hospital, injuries appear to be slight
- (iii) First aid given at scene
- (iv) Precautionary check recommended – this is when an individual is sent to hospital or advised to see a doctor as a precaution, having no obvious injury or distress.

Non-fatal casualties marked as 'not fire-related' have not been excluded due to widespread inappropriate use of this field. The issue is being investigated by the department for Communities and Local Government (CLG).

Primary fires are reportable fires (at the locations listed below i) to vi)) or any fires involving casualties, rescues, or any fire attended by five or more appliances. An appliance is counted if either the appliance, equipment from it or personnel riding on it, were used to fight the fire.

- i) Buildings
- ii) Caravans, trailers etc.
- iii) Vehicles and other modes of transport (not derelict)
- iv) Outdoor equipment and machinery
- v) Agricultural and forestry premises and property
- vi) Other outdoor structures including out-door storage, recycling collection point, post boxes, tunnels, bridges etc.

Reportable fire is an event of uncontrolled burning involving flames, heat or smoke and which the Fire and Rescue Service attended.

Secondary fires are the majority of outdoor fires including grassland and refuse fires unless they involve casualties or rescues, property loss or five or more appliances attend. They include fires in single derelict buildings. They are reported in less detail than other fires and consequently less information concerning them is available.

Source of Ignition is the source of the flame, spark or heat that started the fire.

Section 11: Quality Information

Policy context and supplementary information

Wales has a devolved (since 2004-05) fire and rescue service which is divided into three regions.

North Wales Fire and Rescue Service provides cover for a population of over 690,000 across a geographical area of 2,400 square miles; it has 44 fire stations.

Mid and West Wales Fire and Rescue Service covers over half the area of Wales and a population of almost 900,000. There are 58 fire stations.

South Wales Fire and Rescue Service is one of the largest fire and rescue services in the UK: it serves a population of almost 1.5 million people, covers 1,085 square miles and has 50 fire stations.

In November 2011 the Welsh Government consulted with users of fire statistics with regards to the existing outputs. The consultation closed in February 2012, however you are able to view the consultation and response to the consultation at:

<http://wales.gov.uk/consultations/statistics/fire/?status=closed&lang=en>

Fire Incident data are used as outcome indicators for the *Programme for Government*, the Welsh Government's plan of action for 2011-2016. The indicator measurements are number of fires attended (excluding false alarms) per 10,000 of the population (OU058a) and number of fatal and non-fatal casualties from fires (OU058b). These are included in the category 'Safer Communities for all' (Chapter 7): <http://wales.gov.uk/about/programmeforgov/communities/performance?code=OU058&lang=en>

Fire Safety Advice from the Welsh Government can be found at:

<http://wales.gov.uk/topics/people-and-communities/safety/fire/?lang=en>

Data Source and Scope

Since April 2009 incident data (relating to fires, false alarms and Special Service Incidents) have been submitted by the Fire and Rescue Services to the Department for Communities and Local Government via the Incident Recording System (IRS). IRS does not currently collect data from FRSS in Northern Ireland.

Previously data was collected via the paper based forms FDR1 and FDR3. The change in collection method has allowed a greater volume of data to be captured:

- Data on Special Service Incidents are now recorded
- All fires are recorded; pre-IRS statistics were based on a sampled dataset.
- Detail on secondary fires and chimney fires are now recorded; pre-IRS, only aggregates were available.

Data in this statistical bulletin has been provided by the Department for Communities and Local Government. The most recent statistics cover the financial year 2014-15.

Data for the period April 2013 to March 2015 (revised 2013-14 and provisional 2014-15) were extracted from IRS in June 2015.

Data for the period April 2012 to March 2013 were extracted from IRS in May 2014.

Data for the period April 2011 to March 2012 were extracted from IRS in May 2013.

Data for the period April 2010 to March 2011 were extracted from IRS in May 2012.

Data for the period April 2009 to March 2010 were extracted from IRS in May 2011.

Information on the data collected via IRS system can be found the on Department for Communities and Local Government's website:

<https://www.gov.uk/government/publications/incident-recording-system-for-fire-and-rescue-authorities>

Databases for 1994 to 2008 contain all fires with casualties, but only a sample of other fires. Items and totals have been rounded separately to the nearest final digit so that the total shown may differ slightly from the sum of the items. The data for this period have all been weighted to agreed fire and rescue totals. The detailed analysis of the data other than for casualties, or fires involving casualties is based on the sampled data grossed to fires and rescue service totals.

All percentages in the text and tables of this bulletin are calculated on unrounded figures.

Rounding and Symbols

Data collected via the FDR1 and FDR3 paper forms (prior to 2009-10) are based on sampled datasets. Items and totals have been rounded separately to the nearest final digit, and therefore totals shown may differ slightly from the sum of the items. No rounding has been applied to data from 2009-10 onwards.

The following symbols may have been used in this release:

- negligible (less than half the final digit shown)
- . not applicable
- .. not available
- ~ not available yet
- * disclosive or not sufficiently robust for publication
- p provisional
- r revised

Uses of the Data

- The Welsh Government uses the information in this bulletin to monitor the trends in fires occurring in Wales, for example in deliberate fires, dwelling fires and grassland fires. This helps to monitor the effectiveness of current policy, and for future policy development. The data is also used as evidence for national fire safety initiatives and campaigns.
- The data is used by the fire and rescue services for comparisons and benchmarking. The data aids the allocation of resources and providing community safety projects.
- The data is used by Academic Institutions and Research Councils in funded research projects.
- In recent years Firebrake Wales made use of IRS data supplied by the Welsh Government Community Safety Statistics team to support a number of regional and local projects in Wales.

Some recent examples of how the data provided by the Community Safety Statistics Team have been used are provided below:

Electoral Division/Unitary Authority level IRS data:

- GwirVol funded *Caerau Young Fire Safety Ambassadors Project*. The purpose of the project was to improve fire safety in the local community and its surrounding area (particularly in relation to deliberate fires) by engaging with and involving its young people in voluntary activity. Working along with South Wales FRS and Noddfa, the data were used to better understand the issue with deliberate fires in the community, and to help inform ongoing prevention work.
- *'Fire Safety in the Community - Putting Learning into Practice'*. Unitary Authority/county level IRS data assisted Firebrake in developing and tailoring this training package to help raise awareness of fire safety/risk amongst vulnerable people in the community.

FRS region/all-Wales level IRS data:

- IRS data on fires in schools, deliberate fires, deaths and injuries in fires, firefighter casualties and fires where the source of ignition was 'smokers' materials' have been used in groups such as the all-Wales Joint Arson Group ('JAG') and the Chief Fire Officers Association (Wales) Community Risk Reduction Committee. The incident data has helped to inform the work of all three services across a range of issues and interventions.
- We judge that the quality and reliability of the data is appropriate for these uses.

National Statistics

- This output is designated as National Statistics. National Statistics are produced to high professional standards set out in the National Statistics Code of Practice. They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference.
- The statistics in this bulletin were designated National Statistics in accordance with the arrangements set out in the 'Framework for National Statistics' (2000). In November 2008, the UK Statistics

Authority began an Assessment Programme to formally re-assess current National Statistics outputs for compliance with the Code of Practice for Official Statistics. The UK Statistics Authority (UKSA) published the Fire Statistics (report 208) Assessment report in June 2012. This can be found at the following link:

<http://www.statisticsauthority.gov.uk/assessment/assessment/assessment-reports/index.html>

Data Quality

- Data for the most recent period (2014-15) are provisional. Whilst the data are accurate at the time they extracted, the database is updated throughout the year, and this may result in revised data appearing in subsequent publications. Data for 2013-14 have been revised in this publication and are now considered final, they may however be revised under exceptional circumstances.
- The table below compares 2013-14 data published in July 2014 with the updated data appearing in this bulletin. Revisions to 2013-14 for the categories shown in the table below were all lower than or equal to 0.2 per cent.

The extent to which data have been revised each year has lessened as can be seen by the second table. The notable revision to the number of fatalities for 2011-12 was due to 4 fatalities which had not been recorded in IRS since the coroner's reports had not been concluded by May 2012 (the time of the extraction of data from IRS). However relevant data tables were footnoted accordingly and a note appeared in data quality section of the 'Fire Statistics Wales, 2011-12' bulletin.

	Provisional 2013-14 (published July 2014)	Revised 2013-14 (published July 2015)	Percentage change
All Attendances	28,463	28,481	0.1
All fires	13,162	13,169	0.1
Primary Fires	4,787	4,790	0.1
Secondary	7,797	7,801	0.1
False Alarms	15,301	15,312	0.1
Fatalities	17	17	0.0
Non Fatal Casualties	625	626	0.2

Percentage changes for revised data

	2010-11	2011-12	2012-13	2013-14
All Attendances	1.2	0.2	0.1	0.1
All fires	1.7	0.3	0.2	0.1
Primary Fires	2.1	0.6	0.3	0.1
Secondary	1.6	0.1	0.0	0.1
False Alarms	0.5	0.0	0.0	0.1
Fatalities	5.0	21.1	0.0	0.0
Non Fatal Casualties	4.7	1.9	0.7	0.2

- The Fire Statistics Quality Report covers the general principles and processes leading up to the production of our fire statistics. The report covers various topics including definitions, coverage, timeliness, relevance and comparability. You can see a copy of the report on the Welsh Government website here: <http://wales.gov.uk/statistics-and-research/fire-statistics/?lang=en#/statistics-and-research/fire-statistics/fire-statistics-quality-report/?lang=en>

Disclosure

Disclosure is the result of being able to identify (directly or indirectly) and some personal or otherwise sensitive information being disclosed by the data. Although there are data held in IRS which have the potential to be disclosive we do not consider the data presented in this bulletin to require disclosure control.

More detailed quality information, which is not included in the quality report, is given below.

Comparability

- From April 2009 Fire and Rescue Services began using the Incident Recording System (IRS). This may affect the reporting and recording of incidents.
- Great Britain comparisons: Fire and Rescue Services in England, Scotland and Wales all use IRS to record attendances at incidents and so the raw data are comparable. The data shown in Section 9 are based on the same definitions and so are directly comparable.
- Some minor changes to the detailed classifications were implemented in April 2012, the first since the implementation of the Incident Recording System. Due to only the lowest levels of sub-categories changing the effects on the data in this bulletin are likely to be negligible.

The updated categories are available at:

<https://www.gov.uk/government/publications/incident-recording-system-for-fire-and-rescue-authorities>

- The Department of Communities and Local Government (CLG) carried out a Quality Assurance exercise for their first publication based on IRS data (Fire Statistics Great Britain 2010-11) which highlighted two areas of potential discontinuity due to the change in data collection method.

The first area relates to increases (typically slight) in the numbers of certain types of incident within the data of a handful of Fire and Rescue Services, notably in numbers of primary outdoor fires. These are apparently not real increases, but for example they may rather be the result of a small proportion of incidents in the past having been incorrectly reported as being 'secondary fires' rather than 'primary fires'.

The following conclusions can be drawn:

- it appears that these differences follow from incorrect reporting under the old Fire Data Report system
- the effect on national totals appears to be slight
- there is no suggestion of difference in completeness of recording of casualties.

The second area is the possibility of discontinuity in numbers of non-fatal casualties. Though the totals themselves do not suggest change in recording overall, the new categories have clearly affected sub-totals, notably the category 'precautionary check recommended'. This all follows from two improvements to the way in which non-fatal casualties have been recorded since the introduction of the Incident Recording System:

a. The first change is that each casualty or fatality can be marked as 'not fire-related'. Around eight per cent of non-fatal casualties were marked as not fire-related in April 2010 to March 2011. However, in fire incidents, almost all non-fatal casualties can be expected to be 'fire-related', since very few would have occurred if there had not been a fire. Due to this concern, those non-fatal casualties marked 'not fire-related' have **not** been excluded. It is also worth noting that excluding the 8 per cent of non-fatal casualties would have introduced a large discontinuity compared with data from before the introduction of the new Incident Recording System.

b. The other potential issue arises since the Incident Recording System collects details of the injury of each non-fatal casualty in two questions, the first categorising the casualty as one of: 'severe injury (hospital)', or 'slight injury', or 'first aid' or 'precautionary check advised', while the second question records the type of injury.

This contrasts with the Fire Data Report system where a single question was used instead, with no category for 'first aid'. It appears that casualty cases recorded under Incident Recording System as

'first aid' would have most commonly been recorded under the old Fire Data Report system as 'precautionary check', and a smaller proportion recorded as a specific type of injury. As noted, overall the total of all non-fatal casualty categories (including non-fatal casualties whose severity was either 'first aid' or 'precautionary check recommended' under Incident Recording System) appears to be consistent with totals under the Fire Data Report system.

- In order to assist with comparability between fire and rescue services, all data providers are issued with the same data collection guidance.
- In 2014-15 firefighters were involved in 6 distinct periods and 2 periods of discontinuous of Industrial Action. The strike periods in 2014-15 were as follows:
 - 2nd May 2014 (12:00 – 17:00)
 - 3rd May 2014 (14:00 – 02:00 4th May)
 - 4th May 2014 (10:00 – 15:00)
 - 12th Jun 2014 (9:00 – 9:00 13th June)
 - 21st Jun 2014 (10:00-17:00)
 - 10th Jul 2014 (10:00-19:00)
 - 14th Jul to 21st Jul 2014 - discontinuous strike action (various short periods of time (usually 2 x2 hour slots each day)
 - 9th Aug to 16th Aug 2014 – discontinuous strike action (various short periods of time each day)
- In 2013-14 firefighters were involved in 9 periods of Industrial Action. During this time all incidents which required a response were attended, and all were recorded via IRS. The strike periods in 2013-14 were as follows:
 - 25th September 2013 (12:00-16:00)
 - 1st November 2013 (18:30-23:00)
 - 4th November 2013 (06:00-08:00)
 - 13th November 2013 (10:00-14:00)
 - 13th December 2013 (18:00-22:00)
 - 14th December 2013 (18:00-22:00)
 - 24th December 2013 (19:00-00:00)
 - 31st December 2013 (18:30-00:30 1st Jan 2014)
 - 3rd January 2014 (06:30-08:30)

Related Statistics for Other UK Countries

Fire incident statistics for other UK countries are available at the following links:

- **England:** The Department for Communities and Local Government in England produce a bulletin based on quarterly data for England:
<https://www.gov.uk/government/organisations/department-for-communities-and-local-government/series/fire-statistics-monitor>
and an annual statistical publication:
<https://www.gov.uk/government/publications/fire-statistics>
- **Scotland:** The Scottish Government does not publish quarterly data. Annual fire incident data are available at: <http://www.scotland.gov.uk/Topics/Statistics/Browse/Crime-Justice/PubFires>
- **Northern Ireland:** Equivalent data is not available for Northern Ireland. Annual fire incident data is available from: <http://www.nifrs.org/statistics/>

Revisions

- This bulletin contains provisional data for 2014-15. Whilst the data are accurate at the time they were extracted, the database is updated throughout the year, and this may result in revised data appearing in subsequent publications. 2013-14 data have been revised in this publication and are now considered final. Since IRS is a live system, incidents in 'final data' may be updated, however these revisions will not appear in published data unless in exceptional circumstances.
- The schedule below indicates when data will be revised and finalised.

Data to be revised	When revisions will be made
Fatalities and Casualties	Revised 2014-15 figures to appear in quarterly headline relating to April 2015 - September 2015. (Typically published in January 2016) Final 2014-15 figures (barring exceptional circumstances) to appear in quarterly headline relating to October 2015 - March 2016 and annual bulletin (Fire Statistics Wales 2015-16). (Typically published in June and July 2016 respectively)
Incident data	Final 2014-15 figures (barring exceptional circumstances) to appear in quarterly headline relating to October 2015 - March 2016 and annual bulletin (Fire Statistics Wales 2015-16). (Typically published in June and July 2016 respectively)

- Revised data is marked with an (r) in the statistical bulletin.
- Primary fires data for January to March 2008 have been amended following a change to the weighting used in the sampled dataset. For this reason 2007-08 figures are not comparable with those published by CLG.
- We follow the Welsh Government's statistical revisions policy, details of which are available at: <http://wales.gov.uk/statistics-and-research/about/statement-of-compliance/revisions-errors-postponements/?lang=en>

Other sources of data used

Population data are taken from the Office for National Statistics Mid year Estimates (MYE), published in June 2014. <http://www.ons.gov.uk/ons/taxonomy/index.html?nscl=Population>

Weather data are published by the Met Office. The data used in this bulletin can be found at the following link: <http://www.metoffice.gov.uk/climate/uk/summaries/datasets>

Further information

Annex 1: Fire data available on Statswales

Fires and False Alarms

- Numbers of fires by detailed location, motive and Fire and Rescue Service for 2008-09 (where available) to 2013-14. Relates to Sections 1, 2 and 3.
- Numbers of fires by type (primary, secondary, chimney), Fire and Rescue Service for 2001-02 to 2013-14. Relates to Sections 1 and 2.
- Numbers of accidental primary fires by location, cause, source of ignition, Fire and Rescue Service for 2009-10 to 2013-14. Relates to Section 7.
- Numbers of fires by time, location and type, motive, Fire and Rescue Service for 2008-09 (where available) to 2013-14. Not referred to in this bulletin.
- Numbers of fires in schools by time, schoolroom, cause, Fire and Rescue Service for 2008-09 (where available) to 2013-14. Not referred to in this bulletin.
- Numbers of primary and secondary grassland, woodland and crop fires by month, location, motive and Fire and Rescue Service for 2009-10 to 2013-14. Relates to Sections 2 and 3.
- Numbers of false alarms by reason, Fire and Rescue Service for 2001-02 to 2013-14. Relates to Sections 1 and 5.
- Numbers of fires (by location and type) and false alarms (by reason) by quarter and Fire and Rescue Service 2007-08 to 2013-14. Quarterly data are not published in this bulletin but annual aggregates relate to Sections 1, 2 and 5.
- Numbers of deliberate fires (primary, primary in road vehicles, primary not in road vehicles, secondary) by quarter and Fire and Rescue Service 2007-08 to 2013-14. Quarterly data are not published in this bulletin but annual aggregates relate to Section 3.

<https://statswales.wales.gov.uk/Catalogue/Community-Safety-and-Social-Inclusion/Community-Safety/Fire-Incidents/Fires-and-False-Alarms>

Casualties

- Numbers of fatalities and non-fatal casualties by Fire and Rescue Service for 2001-02 to 2013-14. Relates to Section 4.
- Numbers of total casualties, fatalities and non-fatal casualties by detailed location, motive and Fire and Rescue Service for 2008-09 (where available) to 2013-14. Relates to Section 4.
- Numbers of casualties by age group and Fire and Rescue Service for 2001-02 to 2013-14. Relates to Section 4.
- Numbers of fatalities and non-fatal casualties (whether they were sent to hospital with serious injuries, sent to hospital with slight injuries, given first aid at the scene or advised to have a precautionary check) by type of injury and Fire and Rescue Service for 2001-02 (where available) to 2013-14. Relates to Section 4.
- Numbers of fatalities and non-fatal casualties (whether they were sent to hospital with serious injuries, sent to hospital with slight injuries, given first aid at the scene or advised to have a precautionary check) by quarter and Fire and Rescue Service for 2007-08 (where available) to 2013-14. Quarterly data are not published in this bulletin but annual aggregates relate to Section 4.
- Numbers of fatalities, non-fatal casualties and non-fatal casualties excluding those given first aid and precautionary checks, in accidental dwelling fires by quarter and Fire and Rescue Service for 2007-08 to 2013-14. Quarterly data are not published in this bulletin but annual aggregates relate to Section 4.

<https://statswales.wales.gov.uk/Catalogue/Community-Safety-and-Social-Inclusion/Community-Safety/Fire-Incidents/Casualties>

Smoke Alarms

- Numbers of smoke alarms present at building fires by building type, alarm type, motive Fire and Rescue Service for 2001-02 (where available) to 2013-14. Relates to Section 6.
- Numbers of building fires by presence and operation of smoke alarm, building type, motive and Service for 2001-02 (where available) to 2013-14. Relates to Section 6.
